## Jovian (Jupiter like) Planets

- Homework 4
- Due Thurs, 26 Feb, 6:00am
- Test 2 is Tues, March $3^{\text {rd }}$.
- Covers material through Tues, 2/17.
- Missouri Club is 7:00pm, Mon., March $2^{\text {nd }}$
- Summarizing Qs

1. What is the structure of Jupiter \& how is it different from Earth's?
2. Why is the interior of Jupiter hot?
3. Why does Io, Jupiter's satellite have volcanoes?
4. Why are the inner moons irregular in shape and the big moons spherical?
5. Why do the Jovian planets have rings?

## Jupiter

- Main constituents of gaseous atmosphere:
- Hydrogen: 90\%
- Helium: $10 \%$
- Methane $\left(\mathrm{CH}_{4}\right): 0.2 \%$
- Ammonia $\left(\mathrm{NH}_{3}\right): 0.02 \%$
- Clouds
- Frozen ammonia (white)
- Frozen ammonium hydrosulfide (brown \& red)

## Rotating Jupiter

## Jupiter: The Great Red Spot

Color-coded image, showing which light is reflected off which type of clouds. Uses spectroscopy.
Blue = low clouds
Pink = high, thin clouds
White = high, thick clouds

Movie red spot storm

## What is inside the Jovian planets?

- Structure of Jupiter
- Why is pressure higher nearer the center?
- Pressure supports the mass above.
- Why is the density higher nearer the center?
- Pressure

## Why is Jupiter hot in the center?

- Hot means the atoms are moving faster.
- I am an atom, but think of me as a tennis ball. I am dropped from a height of 6 ft . In what sense does the atom get hotter?
- The atom is moving faster.
- Q: What is the source of the energy that heats the atom?
a. Chemical
b. Nuclear
c. Gravity

## Collapse of the Protosolar Cloud

- I am a hydrogen molecule in the cloud that will become the sun.
- My energy is kinetic (due to motion) and potential (due to gravity).

Energy $=\mathrm{KE}+\mathrm{PE}$
$=1 / 2 \mathrm{~m} \mathrm{v}^{2}-\mathrm{GMm} / \mathrm{r}^{2}$

- Speed v
- Distance $r$ to center of cloud
- Q: When I fall from $r=5$ to $r$ = 1, my KE (and temperature) increases by a factor $\qquad$ - Why is the center of Jupiter hot?
a. About 2
b. About 3
c. About 5
- Material fell and changed gravitational energy into energy of motion.
d. More than 10

## Jupiter's heat sources

- $50 \%$ is from solar energy
- But other $50 \%$ comes from internal heating
- This is gravitational energy released when Jupiter formed.
- Currently stored in interior as heat energy.
- Slowly being radiated away.
- Plus maybe some continuing energy release from contraction.
- Similar effect in Saturn
- But additional effect of same magnitude from ongoing differentiation.
- Separation of H from He.

[see Fig 8.6]

## Moons of Jupiter - Age of Surface

1. The moons are placed in order of the age of the surface. Which moon has the youngest surface? [Hint: Compare the appearance of surfaces of earth \& moon. Earth \& moon had similar number of meteors. Craters on earth have been erased by weathering \& tectonics.]

## Io

- Closest to Jupiter (of Galilean Satellites)
- Strongest tidal forces.
- Active volcanoes
- hot silicate lava, similar to Earth.

Images of same region, 5 months apart.

Haemus Mons -
a volcanic cone

Loki Patera
Thought to be a liquid sulfur lake with a solid sulfur raft.

## Europa

- Not made of ice.
- Density similar to Moon
- Tidal forces keep it geologically active.
- Covered by layer of water ice.
- Appears to be "pack ice" on top of an ocean.
- Water must be warmed by heat from Europa's interior.

Ice rafts

+ the occasional impact crater

Europa’s surface

Nebraska-sized area showing ice and channels.

Ice flow cutting across ridge

|  | Diameter Relative Density \% Reflectivity |  |  |  |
| :---: | :---: | :---: | :---: | :---: |
|  | (km) | Mass | (g/cm $\left.{ }^{\wedge} 3\right)$ |  |
| Moon | 3476 | 1.0 | 3.3 | 12 |
| Callisto | 4820 | 1.5 | 1.8 | 20 |
| Ganymede | 5270 | 2.0 | 1.9 | 40 |
| Europa | 3130 | 0.7 | 3.0 | 70 |
| lo | 3640 | 1.2 | 3.5 | 60 |

## Callisto

- Orbital period: 17 days
- Tidal locking with Jupiter
- Surface temperature $=-140^{\circ} \mathrm{C}$
- appears to be mostly ice.
- $1.8 \times$ density of water
- Many impact craters.

- Not well differentiated
- Close Galileo flybys $\boldsymbol{\rightarrow}$ gravitational field $\boldsymbol{\rightarrow}$ no dense core.
- Geologically dead for 4 billion yrs.

## The Innermost Moons of Jupiter

- Q5: What holds me together?
a. Gravity
b. Atomic bonds between the atoms
- Q6: What holds Io \& Metis together? (Think about the shapes of Io \& Metis.)
a. Gravity for both
b. Bonds for both
c. Gravity for Io; bonds for Metis
d. Gravity for Metis; bonds for Io.

Amalthea
\& Io

## Roche limit

- For a moon in orbit around a planet,
- $\mathrm{P}^{2}=\mathrm{a}^{3} \rightarrow$ different parts of extended body have different orbital periods.
- So body tends to be torn apart. (More important close in.)
- But self-gravity tends to hold it together. (More important far out.)
- Roche's limit is where these two opposing effects are balanced:
$R_{\text {Roche }}=\mathbf{2 . 5}\left(\rho_{\text {planet }} / \rho_{\text {moon }}\right)^{1 / 3} \mathbf{R}_{\text {planet }}$
where $\rho=$ density $\left(\mathrm{kg} / \mathrm{m}^{3}\right)$ and $\mathrm{R}_{\text {planet }}=$ radius of planet.
- If density of planet \& moon are the same, then

$$
\mathbf{R}_{\text {Roche }}=2.5 \mathrm{R}_{\text {planet }}
$$

## The Innermost Moons of Jupiter
