

## Weighing the Universe with Supernovae. Discovery of Dark Energy/ Cosmological Constant—8 Dec

- Homework 11 will be due on the last day of classes (Fri, 10<sup>th</sup>). Answers will be posted after class. No late papers.
- Final exam
  - Covers the entire term with more emphasis on 20<sup>th</sup> century cosmology
  - Wed, 15<sup>th</sup>, 3:00-5:00 in 1415
  - Missouri Club: BPS-1420 on Mon, 12/13, 11:30am - 12:30pm
- Please fill out <http://rateyourclass.msu.edu>
  - Closes when grades are submitted.
- Weighing the universe means to find mass density
- What we will find: Expansion of universe speeds up!
  - “Dark energy” is dominant. Dark energy repulses whereas matter and radiation attract.

## Effect of gravity on expansion of the universe

- Analyze the effect of gravity on the motion of the one galaxy to find the effect of gravity on the expansion of the universe.
  - Newton says: The galaxy feels the pull only of the mass inside the sphere.
  - If there is much mass, the galaxy will slow down, and the expansion of the U will slow down too.
1. Consider H’s constant  $H=v/D$ . If there is little mass in the sphere,  $v$  was constant and  $D$  was smaller in the past. If there is more mass, Hubble’s constant in the past would be \_\_\_\_\_.
    - A. even bigger
    - B. same as with little mass
    - C. not as big

*Do this at home.*

Hint: Consider change in  $v$  due to acceleration. Ignore change in  $D$  due to acceleration, since that is the sum of the changes in  $v$ , which is smaller than the change in  $v$  itself.

## Density parameter

- The density parameter  $\Omega$  is a quantity that compares gravity and motion.
- Compare potential energy and kinetic energy.
- $\Omega = (\text{potential energy}) / (\text{kinetic energy})$

12/8/2010

Ast 207 F2010

## Density parameter of cannon Ball

- Cannonball is shot out of cannon at speed  $v$ .
    - Kinetic energy is  $\frac{1}{2} v^2$ .
  - Gravity pulls on cannonball to slow the motion.
    - Potential energy is  $G M / R$
  - Cannonball will escape if shot fast enough so that
 
$$KE \geq PE$$
  - Define “Density parameter of the cannonball”
 
$$\Omega = PE / KE = 2 G M / (R v^2)$$
1. A cannonball is shot with  $\Omega=0.7$ . Will the cannonball escape? Same question for  $\Omega=1.1$ .
    - A. YY
    - B. YN
    - C. NY
    - D. NN

12/8/2010

Ast 207 F2010

## Density parameter of universe

- Sphere expands and galaxy moves because universe expands.
- Galaxy is moving at speed  $v$ .
  - Kinetic energy is  $\frac{1}{2} v^2$ .
- Hubble's Law connects  $v$  and  $R$ .
 
$$KE = \frac{1}{2} (H R)^2$$
- Gravity pulls on galaxy to slow the motion.
  - Potential energy is  $G M / R$
- Galaxy will escape and Universe will expand forever if moving fast enough
 
$$\Omega = PE/KE \leq 1$$

12/8/2010

Ast 207 F2010

## Does universe expand forever?

- Density parameter should not depend on which galaxy and on size of sphere. Write in terms of the mass density  $\rho$ .
 
$$\Omega = PE/KE = 8\pi G\rho / (3H^2)$$
- 2. If the density parameter  $\Omega=0.2$ , will the universe expand forever?
  - A. Y
  - B. N

# Observations

- Distant SN from Riess et al, 1998, ApJ 116, 1009. Nearby SN from several surveys.
- 3. On upper plot, nearest SN is at
  - a. upper right.
  - b. lower left.
- 4. For the most distant SN, the wavelength of light has increased by a factor of \_\_\_\_ since the SN emitted it.
  - A. 1.00
  - B. 0.5
  - C. 0.99
  - D. 0.01
  - E. 2
- Ideas
  - Magnitudes are more positive for fainter SN.
  - Expansion parameter  $a = D/D_{\text{now}}$
  - Redshift  $a = 1/(1+z)$
  - $z = (\lambda - \lambda_{\text{lab}}) / \lambda_{\text{lab}}$

12/8/2010

Ast 207 F2010

# Models & Observations

- The dotted line shows a model with density parameter  $\Omega=0.2$  (PE/KE=0.2)
  - Model is adjusted to fit observations of nearby SN.
- 5. The distant SN are \_\_\_\_ compared with the model.
  - a. Too bright
  - b. Too faint

12/8/2010

Ast 207 F2010

## Observations

- Lower plot compares data to a model with density parameter  $\Omega = PE/KE = 0.2$
- Distant SN are 20% fainter than model with  $\Omega = 0.2$ .
- 6. The model with  $\Omega = 0.2$  does not agree with the observations. The model must put the SN at (1) \_\_\_ distance to make it agree with the observations. The universe took a (2) \_\_\_ time to expand than the model, and therefore the universe has (3) \_\_\_ mass than the model.
  - Greater for (1) and (3)
  - Smaller for (1) and less for (3)
  - Smaller for (1) and greater for (3)
  - Greater for (1) and less for (3)

12/8/2010

Ast 207 F2010

## Observations

- Lower plot compares data to a model with density parameter  $\Omega = PE/KE = 0.2$
- Distant SN are 20% fainter than model with  $\Omega = 0.2$ .
- Distant SN are 15% fainter than model with no mass ( $\Omega = 0$ )!
  - Longer time to expand than for a universe having no mass at all!
  - Shorter time means expansion slowed down; longer time means expansion sped up.
- Einstein (about 1920, 70 years earlier) thought of "cosmological constant," a kind of stuff where gravity repels.
  - The cosmological constant would make expansion speed up.
  - Modern name for cosmological constant is "dark energy."

## What is the universe made of?

- Spherical sample of universe.  $R$ =moon's orbit. Sample has
  - 3 oz of ordinary matter
  - 1 lb of dark matter
  - 3 lb of dark energy
- Ordinary matter—protons, neutrons, electrons
  - Stars, gas, dust, planets, us
  - $\Omega_{\text{matter}} = 4\%$
- Dark matter—not detected except through gravity
  - $\Omega_{\text{dark matter}} = 23\%$
- Light
  - Mass density is small now. Dominant before universe was 1 Million years old
- Dark energy
  - Repulsive
  - $\Omega_{\text{dark energy}} = 73\%$
- $\Omega_{\text{matter}} + \Omega_{\text{dark matter}} + \Omega_{\text{dark energy}} = 1$
