3. A spaceship is in orbit around the earth at an altitude of $19,290 \mathrm{~km}$. Which one of the following statements best explains why an astronaut experiences "weightlessness"?
A) The spaceship is in free fall so its floor cannot press upward on the astronaut.
B) The pull of the earth on the spaceship is canceled by the pull of the other planets.
C) The location of the spaceship is equidistant between the earth and the moon.
D) The force decreases as the inverse square of the distance from the earth's center.
E) The force of the earth on the spaceship and the force of the spaceship on the earth cancel because they are equal in magnitude but opposite in direction.
F) The centripetal force of the earth on the astronaut in orbit is zero.
G) The earth's gravitation force is balanced by the centrifugal force on the astronaut.
H) Since the spaceship is above the atmosphere, no air presses down on the astronaut.
4. An airplane engine starts from rest; and 2 seconds later, it is rotating with an angular speed of $420 \mathrm{rev} / \mathrm{min}$. If the angular acceleration is constant, how many revolutions does the propeller undergo during this time?
A) 24
B) 14
C) 7
D) 49
E) 150
F) 17
G) 21
H) 1200

7. A solid disk with a mass of 0.50 kg is rotating on a frictionless surface with an angular speed of $15.0 \mathrm{rad} / \mathrm{s}$. Another disk just above the first with the same radius is dropped onto the lower disk. Kinetic
 friction between the disks brings both disks to a common angular speed of $3.00 \mathrm{rad} / \mathrm{s}$. What is the mass of the top disk?
A) 0.50 kg
B) 1.00 kg
C) 1.50 kg
D) 5.00 kg
E) 2.50 kg
F) 3.00 kg
G) 4.00 kg
