Elastic collisions (x-components of the velocities)

Initial Equal masses Final $v_{1i} = 0 \qquad v_{2i} = 0 \qquad v_{1f} = 0 \qquad m$

 $(m_1 = m_2 = m)$ masses cancel in both equations

Momentum conservation: $v_{1i} = v_{1f} + v_{2f}$

Energy conservation: $v_{1i}^2 = v_{1f}^2 + v_{2f}^2$

 $v_{1f}^{2} + v_{2f}^{2} + 2v_{1f}v_{2f} = v_{1f}^{2} + v_{2f}^{2}$ $2v_{1f}v_{2f} = 0$ $v_{1f} = 0; \quad v_{2f} = v_{1i}$

Incoming mass stops, target mass gets initial momentum

Elastic collisions (x-components of the velocities)

Initial Equal masses Final $v_{1i} = 0 \qquad v_{2i} = 0 \qquad v_{1f} = 0 \qquad m$

 $(m_1 = m_2 = m)$ masses cancel in both equations

Momentum conservation: $v_{1i} = v_{1f} + v_{2f}$

Energy conservation: $v_{1i}^2 = v_{1f}^2 + v_{2f}^2$

 $\begin{aligned} v_{1f}^2 + v_{2f}^2 + 2v_{1f}v_{2f} &= v_{1f}^2 + v_{2f}^2 \\ 2v_{1f}v_{2f} &= 0 \\ v_{1f} &= 0; \quad v_{2f} = v_{1i} \end{aligned}$

Incoming mass stops, target mass gets initial momentum

Momentum conservation: $m_1 v_{1i} = m_1 v_{1f} + m_2 v_{2f} \implies v_{1i} - v_{1f} = \frac{m_2}{m_1} v_{2f}$

Energy conservation: $\frac{1}{2} m_1 v_{1i}^2 = \frac{1}{2} m_1 v_{1f}^2 + \frac{1}{2} m_2 v_{2f}^2 \implies v_{1i}^2 - v_{1f}^2 = \frac{m_2}{m_1} v_{2f}^2$

Solve for v_{1f} , v_{2f}

Elastic collisions with arbitrary masses (solve for final velocities)

$$\begin{array}{c|c}
\underline{v_{1i}} & \underline{v_{2i}} = 0 \\
\hline
m_1 & m_2
\end{array}$$
Unequal masses
$$\begin{array}{c}
\underline{v_{1f}} & \underline{v_{2f}} \\
\hline
m_1 & m_2
\end{array}$$

Momentum conservation:

$$m_1 v_{1i} = m_1 v_{1f} + m_2 v_{2f}$$
 $\Rightarrow v_{1i} - v_{1f} = \frac{m_2}{m_1} v_{2f}$ (1)

Energy conservation:
$$\frac{1}{2}m_1v_{1i}^2 = \frac{1}{2}m_1v_{1f}^2 + \frac{1}{2}m_2v_{2f}^2 \implies v_{1i}^2 - v_{1f}^2 = \frac{m_2}{m_1}v_{2f}^2 \quad (2)$$

rewrite (2) as
$$(v_{1i} - v_{1f})(v_{1i} + v_{1f}) = \frac{m_2}{m_1} v_{2f}^2$$

insert (1)
$$\frac{m_2}{m_1} v_{2f} \left(v_{1i} + v_{1f} \right) = \frac{m_2}{m_1} v_{2f}^2 \implies v_{1i} + v_{1f} = v_{2f} \quad (3)$$

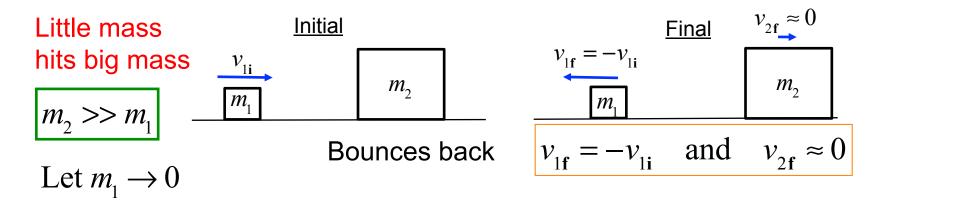

(1) with (3)
$$v_{1i} - v_{1f} = \frac{m_2}{m_1} (v_{1i} + v_{1f}) \implies v_{1f} = \left[\frac{m_1 - m_2}{m_1 + m_2} \right] v_{1i}$$
 (4)

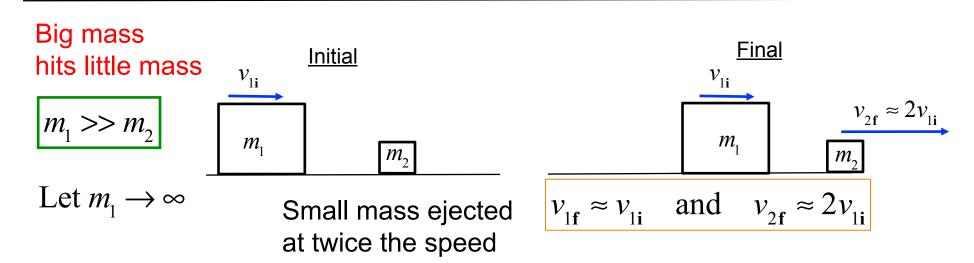

(1) with (4)
$$v_{1i} - \left[\frac{m_1 - m_2}{m_1 + m_2}\right] v_{1i} = \frac{m_2}{m_1} v_{2f} \implies v_{2f} = \left[\frac{2m_1}{m_1 + m_2}\right] v_{1i}$$

Elastic collisions with arbitrary masses

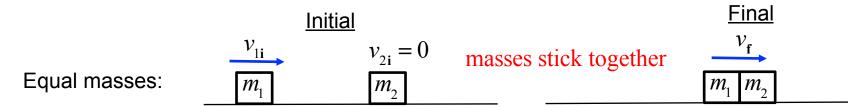

$$v_{1f} = \frac{m_1 - m_2}{m_1 + m_2} v_{1i}$$
 and $v_{2f} = \frac{2m_1}{m_1 + m_2} v_{1i}$

Equal mass solution is here too

<u>Inelastic collisions</u> (with only internal forces affecting the motion)

(x-components of the velocities)

Momentum conservation:
$$m_1 v_{1i} = (m_1 + m_2) v_f$$

Energy NOT conserved:

$$v_{\rm f} = \frac{m_{\rm l}}{m_{\rm l} + m_{\rm 2}} v_{\rm li}$$

How much kinetic energy was converted to heat in the collision.

$$K_{\mathbf{i}} = \frac{1}{2} m_{1} v_{1\mathbf{i}}^{2}$$

$$K_{\mathbf{f}} = \frac{1}{2} \left(m_{1} + m_{2} \right) v_{\mathbf{f}}^{2} = \frac{1}{2} \left(m_{1} + m_{2} \right) \left[\frac{m_{1}}{m_{1} + m_{2}} v_{1\mathbf{i}} \right]^{2}$$

$$= \frac{m_{1}^{2}}{2 \left(m_{1} + m_{2} \right)} v_{1\mathbf{i}}^{2} = \frac{m_{1}}{m_{1} + m_{2}} \left[\frac{1}{2} m_{1} v_{1\mathbf{i}}^{2} \right]$$

$$= \frac{m_{1}}{m_{1} + m_{2}} K_{\mathbf{i}}$$

$$\Delta K = K_{\mathbf{f}} - K_{\mathbf{i}} = \frac{m_1}{m_1 + m_2} K_{\mathbf{i}} - K_i$$
$$= \left(\frac{m_2}{m_1 + m_2}\right) K_i \text{ (converted to heat)}$$

If
$$m_2 >> m_1$$
, $\Delta K \approx K_i$ (all kinetic energy converted to heat)

$$\begin{aligned} & m_1 = 6 \, \text{kg}, \quad m_2 = 3 \, \text{kg} \\ & m_1 \vec{\mathbf{v}}_{1\mathbf{f}} + m_2 \vec{\mathbf{v}}_{2\mathbf{f}} = 0 \\ & \vec{\mathbf{v}}_1 = -\frac{m_2}{m_1} \vec{\mathbf{v}}_2 \quad \text{speeds:} \quad v_1 = \frac{m_2}{m_1} v_2 \quad = \frac{3 \, \text{kg}}{6 \, \text{kg}} v_2 \quad \Rightarrow \quad v_1 = \frac{1}{2} v_2 \quad m_1 = 6 \, \text{kg} \\ & m_2 = 3 \, \text{kg} \end{aligned}$$

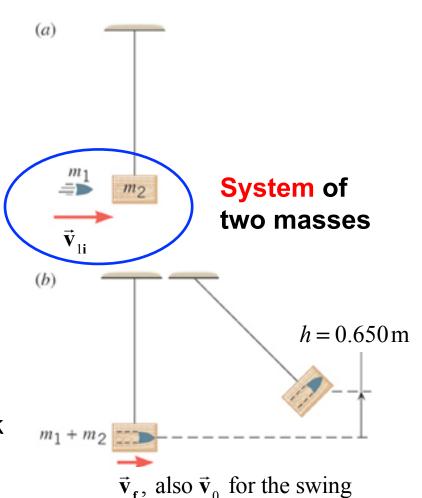

Example: A Ballistic Pendulum

The mass of the block of wood is 2.50-kg and the mass of the bullet is 0.0100-kg. The block swings to a maximum height of 0.650 m above the initial position.

Find the initial speed of the bullet.

Strategy – 1) After the bullet hits the block the swing will conserve energy. From the height determine the starting velocity.

2) Use this velocity as the final velocity of the collision. Then momentum conservation determines the bullet's initial velocity.

Apply conservation of energy to the swinging motion:

$$K + U = K_0 + U_0$$
$$0 + mgh = \frac{1}{2}mv_0^2 + 0$$
$$v_0 = \sqrt{2gh}$$

Apply conservation of momentum in the collision:

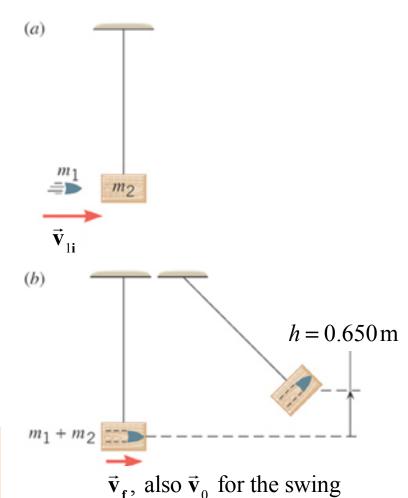

$$|\vec{\mathbf{p}}_{Total,i}| = |\vec{\mathbf{p}}_{bullet,i}| + |\vec{\mathbf{p}}_{block,i}| = m_1 v_{1i} + 0$$

$$|\vec{\mathbf{p}}_{Total,f}| = (m_1 + m_2) v_f$$

Momentum conservation:
$$\vec{\mathbf{p}}_{Total,\mathbf{f}} = \vec{\mathbf{p}}_{Total,\mathbf{i}}$$

$$v_{1\mathbf{i}} = \frac{(m_1 + m_2)}{m_1} v_{\mathbf{f}} = \frac{(m_1 + m_2)}{m_1} \sqrt{2gh}$$

$$= \frac{2.50 + .01}{.01} \sqrt{2(9.81)(0.65)} \, \text{m/s} = 896 \, \text{m/s}$$

Inelastic collisions (with only internal forces affecting the motion)

Inelastic collisions (with only internal forces affecting the motion)

(x-components of the velocities)

Energy **NOT** conserved:

Masses initially moving toward each other

(x-components of the velocities)

Momentum conservation: $m_1 v_{1i} + m_2 v_{2i} = (m_1 + m_2) v_f$

$$v_{\mathbf{f}} = \frac{m_1 v_{1i} + m_2 v_{2i}}{m_1 + m_2}$$

Energy NOT conserved:

For example: $v_{1i} = +5.0 \text{ m/s}$, $v_{2i} = -10.0 \text{ m/s}$, $m_1 = m_2 = m \text{ (same mass)}$

$$v_{\mathbf{f}} = \frac{m_1 v_{1i} + m_2 v_{2i}}{m_1 + m_2} = \frac{m}{2m} (v_{1i} + v_{2i}) = 0.5(+5 - 10) \,\text{m/s} = -2.5 \,\text{m/s}$$
