Chapter 6

Impulse and Momentum

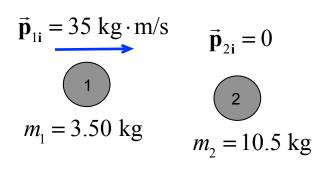

Continued

Momentum conservation can be used to solve collision problems if there are no external forces affecting the motion of the masses.

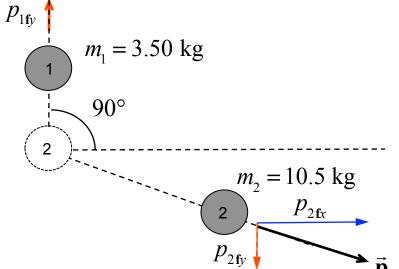

Energy conservation can be used to solve a collision problem if it is stated explicity that the collision is ELASTIC.

If two masses in a collision stick together, the collision must be INELASTIC. Energy conservation cannot be used unless the energy lost or gained is provided.

In the elastic collision, m_1 is deflected upward at 90°.

Determine the final momentum vector for both masses.

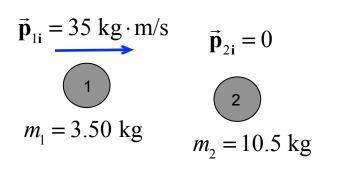

Momentum conservation

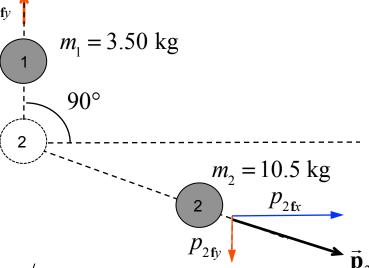

x-components: $p_{1i} = p_{2fx} = 35 \text{ kg} \cdot \text{m/s}$

y-components: $p_{1fy} = -p_{2fy}$ (need this)

In the elastic collision, m_1 is deflected upward at 90°.

Determine the final momentum vector for both masses.

Momentum conservation

x-components:
$$p_{1i} = p_{2fx} = 35 \text{ kg} \cdot \text{m/s}$$

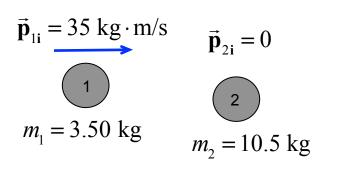

y-components:
$$p_{1fy} = -p_{2fy}$$
 (need this)

Kinetic Energies

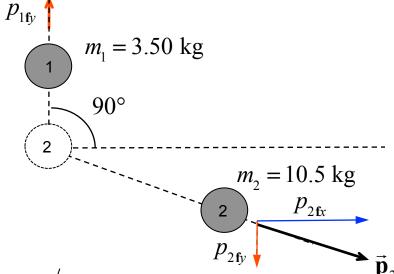

$$K_{i} = \frac{p_{1i}^{2}}{2m_{1}}$$

$$K_{f} = \frac{p_{1fy}^{2}}{2m_{1}} + \frac{p_{2fx}^{2} + p_{2fy}^{2}}{2m_{2}}$$

In the elastic collision, m_1 is deflected upward at 90°.

Determine the final momentum vector for both masses.

Momentum conservation

x-components:
$$p_{1i} = p_{2fx} = 35 \text{ kg} \cdot \text{m/s}$$

y-components: $p_{1fy} \neq -p_{2fy}$ (need this)

Kinetic Energies,

$$K_{i} = \frac{p_{1i}^{-}}{2m_{1}}, y' y' y'$$

$$K_{f} = \frac{p_{1fy}^{2'}}{2m_{1}} + \frac{p_{2fx}^{2} + p_{2fy}^{2}}{2m_{2}}$$

$$\frac{p_{2fy}^{2}}{2m_{1}} + \frac{p_{1i}^{2} + p_{2fy}^{2}}{2m_{2}}$$

In the elastic collision, m_1 is deflected upward at 90°.

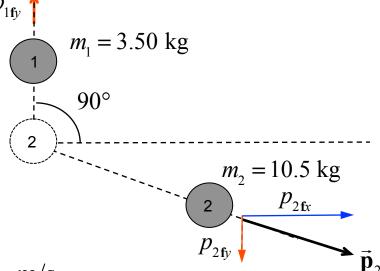

$$\vec{\mathbf{p}}_{1i} = 35 \text{ kg} \cdot \text{m/s}$$

$$\vec{\mathbf{p}}_{2i} = 0$$

$$m_1 = 3.50 \text{ kg}$$

$$m_2 = 10.5 \text{ kg}$$

Determine the final momentum vector for both masses.

Momentum conservation

x-components:
$$p_{1i} = p_{2fx} = 35 \text{ kg} \cdot \text{m/s}$$

y-components: $p_{1fy} \neq -p_{2fy}$ (need this)

Energy conservation

Kinetic Energies
$$K_{i} = \frac{p_{1i}^{2}}{2m_{1}}$$

$$K_{f} = \frac{p_{1fy}^{2'}}{2m_{1}} + \frac{p_{2fx}^{2'} + p_{2fy}^{2}}{2m_{2}}$$

$$\frac{p_{2fy}^{2}}{2m_{1}} + \frac{p_{1i}^{2} + p_{2fy}^{2}}{2m_{2}}$$

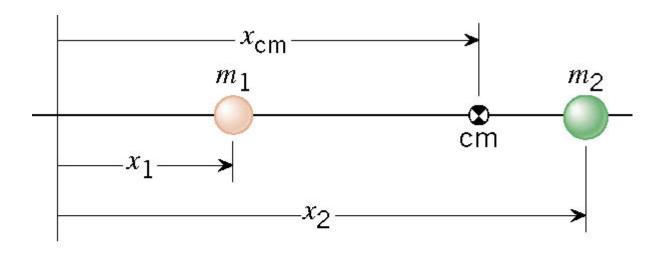

$$K_{\rm f} = K_{i}$$

$$p_{2\rm fy}^{2} \left(\frac{1}{m_{1}} + \frac{1}{m_{2}}\right) = p_{1\rm i}^{2} \left(\frac{1}{m_{1}} - \frac{1}{m_{2}}\right)$$

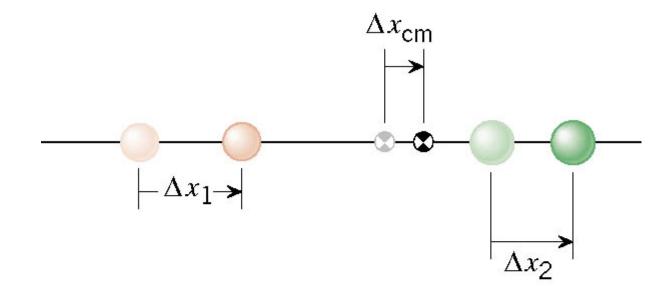

$$p_{2\rm fy} = \pm \frac{1}{\sqrt{2}} p_{1\rm i} \quad \Rightarrow \quad p_{2\rm fy} = -24.7 \text{ kg} \cdot \text{m/s}$$

$$\text{therefore, } p_{1\rm fy} = +24.7 \text{ kg} \cdot \text{m/s}$$

The center of mass is a point that represents the average location for the total mass of a system.

$$x_{cm} = \frac{m_1 x_1 + m_2 x_2}{m_1 + m_2}$$

$$\Delta x_{cm} = \frac{m_1 \Delta x_1 + m_2 \Delta x_2}{m_1 + m_2} \qquad \Longrightarrow \qquad v_{cm} = \frac{m_1 v_1 + m_2 v_2}{m_1 + m_2}$$

$$v_{cm} = \frac{m_1 v_1 + m_2 v_2}{m_1 + m_2}$$

In an isolated system, the total linear momentum does not change, therefore the velocity of the center of mass does not change.

BEFORE

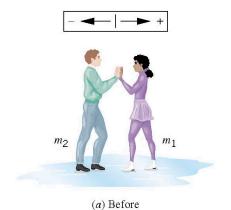

$$v_{cm} = \frac{m_1 v_1 + m_2 v_2}{m_1 + m_2} = 0$$

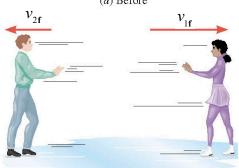

AFTER

$$v_{cm} = \frac{m_1 v_1 + m_2 v_2}{m_1 + m_2}$$

$$= \frac{(54 \text{ kg})(+2.5 \text{ m/s}) + (88 \text{ kg})(-1.5 \text{ m/s})}{88 \text{ kg} + 54 \text{ kg}}$$

$$= 0.00$$

Forces and Newton's Laws of Motion

Force Magnitudes

Gravitational Force: $F_G = mg$ (magnitude), direction downward, weight Elastic Forces: (stretched spring) $F_S = kx$ (magnitude), inward at the ends Compression: (squeezed spring or object) normal forces, n, \perp contact Frictional: opposes motion, Static: $f_{Max} = \mu_S F_{\perp}$, then Kinetic: $f_K = \mu_K F_{\perp}$

Net Force: $\vec{\mathbf{F}}_{\text{Net}} = \vec{\mathbf{F}}_1 + \vec{\mathbf{F}}_2 + \dots$ on a single object (magnitude and direction)

Newton's 1st Law: speed and direction do not change, if & only if $\vec{\mathbf{F}}_{Net} = 0$

Newton's 2nd Law: $\vec{\mathbf{F}}_{Net} = m\vec{\mathbf{a}}$

Newton's 3rd Law for two masses (1,2) in contact: $\vec{\mathbf{F}}_{12} = -\vec{\mathbf{F}}_{21}$

Decomposition to components: $\vec{\mathbf{F}} = F_x \hat{\mathbf{i}} + F_y \hat{\mathbf{j}}$, $F_x = F \cos \theta$, $F_y = F \sin \theta$ Components to magnitude angle: $F = \sqrt{F_x^2 + F_y^2}$, $\theta = \tan^{-1}(F_y/F_x)$

Summaries and Examples Energy and energy conservation Momentum and momentum conservation

Energy and energy conservation

Work:
$$W = F(\cos\theta)\Delta x$$

Kinetic Energy:
$$K = \frac{1}{2}mv^2$$

Work changes kinetic energy:
$$W = K - K_0 = \frac{1}{2}mv^2 - \frac{1}{2}mv_0^2$$

Conservative forces \Rightarrow Potential Energy

Gravitational Potential Energy: $U_G = mgy$

Ideal Spring Potential Energy: $U_S = \frac{1}{2}kx^2$

Total Energy: E = K + U

Work by non-conservative forces (friction, humans, explosions)

changes total energy:
$$K + U = K_0 + U_0 + W_{NC}$$

If $W_{NC} = 0$, there is total energy conservation:

$$E = E_0 \quad \Longrightarrow \quad K + U = K_0 + U_0$$

Average power = Work/time = (Energy change)/time = $F \overline{v}$

Momentum and momentum conservation

Impulse:
$$\vec{\mathbf{J}} = \vec{\mathbf{F}}t$$

Momentum: $\vec{\mathbf{p}} = m\vec{\mathbf{v}}$

Net average impulse changes momentum:

$$\sum \overline{\vec{\mathbf{F}}} \Delta t = \vec{\mathbf{p}} - \vec{\mathbf{p}}_0 = m \vec{\mathbf{v}}_f - m \vec{\mathbf{v}}_0$$

Momentum of 2 masses in collision: $\vec{\mathbf{p}}_{total} = m_1 \vec{\mathbf{v}}_1 + m_2 \vec{\mathbf{v}}_2$

No net external force active, momentum is conserved

$$\vec{\mathbf{p}}_{Total,\mathbf{f}} = \vec{\mathbf{p}}_{Total,\mathbf{i}} \implies m_1 \vec{\mathbf{v}}_{1\mathbf{f}} + m_2 \vec{\mathbf{v}}_{2\mathbf{f}} = m_1 \vec{\mathbf{v}}_{1\mathbf{i}} + m_2 \vec{\mathbf{v}}_{2\mathbf{i}}$$

Center of mass position:
$$x_{cm} = \frac{m_1 x_1 + m_2 x_2}{m_1 + m_2}$$
, and velocity $\vec{\mathbf{v}}_{cm} = \frac{m_1 \vec{\mathbf{v}}_1 + m_2 \vec{\mathbf{v}}_2}{m_1 + m_2}$

Conservation of momentum $\Rightarrow \vec{\mathbf{v}}_{cm}$ remains constant

A space probe travels with a momentum of $+6.0\times10^7~{\rm kg\cdot m\,/\,s}$. A retrorocket fires for 10 s, with a force magnitude of $2.0\times10^6~{\rm N}$, that slows the speed of the probe. What is the momentum of the probe after the rocket ceases to fire?

a)
$$2.0 \times 10^7 \text{ kg} \cdot \text{m/s}$$

b)
$$4.0 \times 10^7 \text{ kg} \cdot \text{m/s}$$

c)
$$6.0 \times 10^7 \text{ kg} \cdot \text{m/s}$$

d)
$$8.0 \times 10^7 \text{ kg} \cdot \text{m/s}$$

e)
$$10.0 \times 10^7 \text{ kg} \cdot \text{m/s}$$

A space probe travels with a momentum of $+6.0\times10^7~{\rm kg\cdot m\,/\,s}$. A retrorocket fires for 10 s, with a force magnitude of $2.0\times10^6~{\rm N}$, that slows the speed of the probe. What is the momentum of the probe after the rocket ceases to fire?

d)
$$8.0 \times 10^7 \text{ kg} \cdot \text{m/s}$$

e)
$$10.0 \times 10^7 \text{ kg} \cdot \text{m/s}$$

Impulse changes momentum

$$\mathbf{F}\Delta t = \mathbf{p}_{f} - \mathbf{p}_{i}$$

$$\mathbf{p}_{f} = \mathbf{p}_{i} + \mathbf{F}\Delta t$$

$$\mathbf{p}_{f} = (+6.0 \times 10^{7} \,\mathrm{N \cdot s}) + (-2.0 \times 10^{6} \,\mathrm{N})(10 \,\mathrm{s})$$

$$= +4.0 \times 10^{7} \,\mathrm{N \cdot s}$$

Two identical 2.0-kg objects are involved in a collision. The objects are on a frictionless track. The initial velocity of object A is +12 m/s and the initial velocity of object B is -6.0 m/s. What is the final velocity of the two objects?

- a) Object A moves at -6.0 m/s and B moves at +12 m/s.
- **b)** Object A moves at +9.0 m/s and B moves at +9.0 m/s.
- c) Object A moves at -6.0 m/s and B moves at +6.0 m/s.
- d) Object A moves at -12 m/s and B moves at +6.0 m/s.
- e) This cannot be determined without energy information.

must say if elastic or inelastic

Two identical 2.0-kg objects are involved in a collision. The objects are on a frictionless track. The initial velocity of object A is +12 m/s and the initial velocity of object B is -6.0 m/s. What is the final velocity of the two objects?

- a) Object A moves at -6.0 m/s and B moves at +12 m/s.

- d) Object A moves at -12 m/s and B moves at +6.0 m/s.
- e) This cannot be determined without energy information.

Momentum is conserved

$$\vec{\mathbf{p}}_{1f} + \vec{\mathbf{p}}_{2f} = \vec{\mathbf{p}}_{1i} + \vec{\mathbf{p}}_{2i}$$

(all are x components) $mv_{1f} + mv_{2f} = mv_{1i} + mv_{2i}$ (m cancels in each term)

$$v_{1f} + v_{2f} = (+12\text{m/s}) + (-6\text{m/s}) = +6\text{m/s}$$

Only know the sum: $v_{1f} + v_{2f} = +6$ m/s, Need energy equation

Is this an **ELASTIC** or **INELASTIC** collision?

an elastic

Two identical 2.0-kg objects are involved in collision. The objects are on a frictionless track. The initial velocity of object A is +12 m/s and the initial velocity of object B is -6.0 m/s. What is the final velocity of the two objects?

Energy is also conserved

$$v_{1f}^2 + v_{2f}^2 = v_{1i}^2 + v_{2i}^2 = 144 \,\text{m}^2/\text{s}^2 + 36 \,\text{m}^2/\text{s}^2$$
 (energy conservation, $\frac{1}{2}m$ cancels)
 $v_{1f}^2 + v_{2f}^2 = 180 \,\text{m}^2/\text{s}^2$ $v_{2f}^2 = +6m/\text{s} - v_{1f}$ (previous slide)

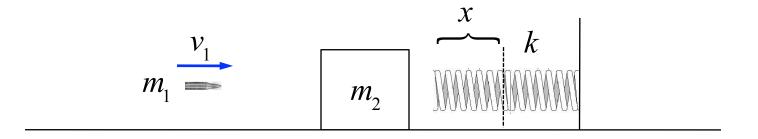

$$v_{1f}^2 + (6 \text{ m/s} - v_{1f})^2 = 2v_{1f}^2 - (12 \text{ m/s})v_{1f} + 36\text{m}^2/\text{s}^2$$

Quadratic Equation: $v_{1f}^2 - (6\text{m/s})v_{1f} - 72\text{ m}^2/\text{s}^2 = 0$
 $v_{1f} = (+3 \pm \sqrt{9 + 72})\text{m/s} = (+3 \pm 9)\text{m/s}$
 $v_{1f} = -6 \text{ m/s}$ (other solution - $v_{1f} = +12 \text{ m/s}$, no collision)

a) Object A moves at -6.0 m/s and B moves at +12 m/s.

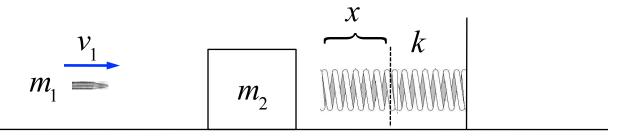

Example:

An 11-g bullet is fired horizontally into a 110-g wooden block that is initially at rest on a frictionless horizontal surface and a fixed spring having spring constant 183 N/m. The bullet becomes embedded in the block. The bullet-block system compresses the spring by a maximum amount 85 cm. What was the initial velocity of the bullet?

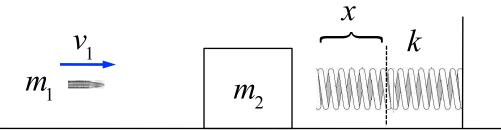

Strategy:

- 1) Momentum conservation bullet + block
- 2) Energy conservation in spring compression

$$p_1 = m_1 v_1, \quad p = (m_1 + m_2)v \implies p_1 = p$$

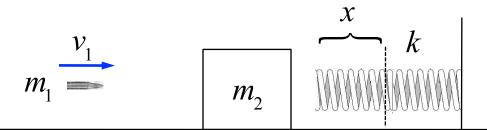

$$p_1 = m_1 v_1, \quad p = (m_1 + m_2) v \implies p_1 = p$$

2) Energy conservation in spring compression

Kinetic Energy of block and bullet: $K_i = p_1^2 / 2(m_1 + m_2)$

Potential Energy of compressed spring : $U = \frac{1}{2}kx^2$

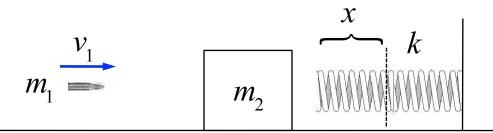

$$p_1 = m_1 v_1, \quad p = (m_1 + m_2) v \implies p_1 = p$$

2) Energy conservation in spring compression

Kinetic Energy of block and bullet: $K_i = p_1^2 / 2(m_1 + m_2)$

Potential Energy of compressed spring : $U = \frac{1}{2}kx^2$

Energy Conservation : $K + U = K_i + U_i$; $U_i = 0, K = 0$

$$p_1 = m_1 v_1, \quad p = (m_1 + m_2) v \implies p_1 = p$$

2) Energy conservation in spring compression

Kinetic Energy of block and bullet:
$$K_i = p_1^2 / 2(m_1 + m_2)$$

Potential Energy of compressed spring : $U = \frac{1}{2}kx^2$

Energy Conservation :
$$K + U = K_i + U_i$$
 ; $U_i = 0, K = 0$

$$\frac{1}{2}kx^2 = p_1^2/2(m_1 + m_2)$$
$$p_1 = x\sqrt{k(m_1 + m_2)}$$

$$m_1 v_1 = (0.85 \text{ m}) \sqrt{(183 \text{ N/m})(0.121 \text{kg})} = 4.00 \text{ N} \cdot \text{s}$$

 $v_1 = 4.00 \text{ N} \cdot \text{s} / (0.011 \text{kg}) = 364 \text{ m/s}$
