# CHAPTER 10 - TIME EVOLUTION OF QUANTUM SYSTEMS

OUTLINE of the chapter.

Section 10.1 ► Schroedinger representation

Section 10.2 ► Heisenberg representation

Section 10.3 ► Interaction representation

- Time dependent perturbations
- Time ordered products

### Section 10.1 ►

The Schroedinger representation

You know ...

- ∃ a Hilbert space of states (kets)
- Observables are Hermitian operators
- H is the generator of translation in time .......

i 
$$\frac{3}{3t}$$
 |  $4$ ,  $t$  > = H |  $4$ ,  $t$  > ( $t$  = 1)

We need a boundary and it in ;

Say |  $4$ ,  $6$  > = |  $4$  >.

Solution is |  $4$ ,  $t$  > =  $e^{-i}$  Ht |  $4$  >.

Or, for arbitrary time at

|  $4$  |  $4$  |  $4$  |  $4$  |  $4$  |  $4$  |  $4$  |  $4$  |  $4$  |  $4$  |  $4$  |  $4$  |  $4$  |  $4$  |  $4$  |  $4$  |  $4$  |  $4$  |  $4$  |  $4$  |  $4$  |  $4$  |  $4$  |  $4$  |  $4$  |  $4$  |  $4$  |  $4$  |  $4$  |  $4$  |  $4$  |  $4$  |  $4$  |  $4$  |  $4$  |  $4$  |  $4$  |  $4$  |  $4$  |  $4$  |  $4$  |  $4$  |  $4$  |  $4$  |  $4$  |  $4$  |  $4$  |  $4$  |  $4$  |  $4$  |  $4$  |  $4$  |  $4$  |  $4$  |  $4$  |  $4$  |  $4$  |  $4$  |  $4$  |  $4$  |  $4$  |  $4$  |  $4$  |  $4$  |  $4$  |  $4$  |  $4$  |  $4$  |  $4$  |  $4$  |  $4$  |  $4$  |  $4$  |  $4$  |  $4$  |  $4$  |  $4$  |  $4$  |  $4$  |  $4$  |  $4$  |  $4$  |  $4$  |  $4$  |  $4$  |  $4$  |  $4$  |  $4$  |  $4$  |  $4$  |  $4$  |  $4$  |  $4$  |  $4$  |  $4$  |  $4$  |  $4$  |  $4$  |  $4$  |  $4$  |  $4$  |  $4$  |  $4$  |  $4$  |  $4$  |  $4$  |  $4$  |  $4$  |  $4$  |  $4$  |  $4$  |  $4$  |  $4$  |  $4$  |  $4$  |  $4$  |  $4$  |  $4$  |  $4$  |  $4$  |  $4$  |  $4$  |  $4$  |  $4$  |  $4$  |  $4$  |  $4$  |  $4$  |  $4$  |  $4$  |  $4$  |  $4$  |  $4$  |  $4$  |  $4$  |  $4$  |  $4$  |  $4$  |  $4$  |  $4$  |  $4$  |  $4$  |  $4$  |  $4$  |  $4$  |  $4$  |  $4$  |  $4$  |  $4$  |  $4$  |  $4$  |  $4$  |  $4$  |  $4$  |  $4$  |  $4$  |  $4$  |  $4$  |  $4$  |  $4$  |  $4$  |  $4$  |  $4$  |  $4$  |  $4$  |  $4$  |  $4$  |  $4$  |  $4$  |  $4$  |  $4$  |  $4$  |  $4$  |  $4$  |  $4$  |  $4$  |  $4$  |  $4$  |  $4$  |  $4$  |  $4$  |  $4$  |  $4$  |  $4$  |  $4$  |  $4$  |  $4$  |  $4$  |  $4$  |  $4$  |  $4$  |  $4$  |  $4$  |  $4$  |  $4$  |  $4$  |  $4$  |  $4$  |  $4$  |  $4$  |  $4$  |  $4$  |  $4$  |  $4$  |  $4$  |  $4$  |  $4$  |  $4$  |  $4$  |  $4$  |  $4$  |  $4$  |  $4$  |  $4$  |  $4$  |  $4$  |  $4$  |  $4$  |  $4$  |  $4$  |  $4$  |  $4$  |  $4$  |  $4$  |  $4$  |  $4$  |  $4$  |  $4$  |  $4$  |  $4$  |  $4$  |  $4$  |  $4$  |  $4$  |  $4$  |  $4$  |  $4$  |  $4$  |  $4$  |  $4$  |  $4$  |  $4$  |  $4$  |  $4$  |  $4$  |  $4$  |  $4$  |  $4$  |  $4$  |  $4$  |  $4$  |  $4$  |  $4$  |  $4$  |  $4$  |  $4$  |  $4$  |  $4$  |  $4$  |  $4$  |  $4$  |  $4$  |  $4$  |  $4$  |  $4$  |  $4$  |  $4$  |  $4$  |  $4$  |  $4$  |  $4$  |  $4$  |  $4$  |  $4$  |  $4$  |  $4$  |  $4$  |  $4$  |  $4$  |  $4$  |  $4$  |  $4$  |  $4$  |  $4$  |  $4$  |  $4$  |  $4$  |  $4$  |  $4$  |  $4$  |  $4$  |  $4$  |  $4$  |  $4$  |  $4$  |  $4$  |  $4$  |  $4$  |  $4$  |  $4$  |  $4$  |  $4$  |  $4$  |  $4$  |  $4$  |  $4$  |  $4$  |  $4$  |  $4$ 

## Section 10.2 ▶

# The Heisenberg representation

We define  $|\psi\rangle_{H} = |\psi_{0}\rangle$ , independent of time.

And we require, for any observable B,

$$<\psi,t\mid B(t)\mid \psi,t>=<\psi,t\mid B(t)\mid \psi,t>$$
 $<\psi,t\mid B(t)\mid \psi,t>=<\psi,t\mid e^{iHt}$   $B_{s}e^{-iHt}\mid \psi,t>$ 
So
$$B_{H}(t)=e^{iHt}$$
  $B_{s}e^{-iHt}$ 
(In the Schroedinger representation,  $B$  does not depend on  $t$ .)

Time dependence in terms of diff. eqs.,

$$i\frac{\partial B}{\partial t} = e^{iHt}(-HB_s)e^{-iHt} + e^{iHt}(B_sH)e^{-iHt}$$

$$= -HB(H) + B(H)H = -[H,B(H)]$$

$$\frac{\partial B}{\partial t} = i[H,B(H)]$$
with initial and differ B(0) = Bs.

For example, consider  $H = \frac{p^2}{2m} + Vh$ .

when p is the generator g translation in space  $f(x+a) = e^{ipa} f(x) e^{-ipa}.$  f(x+e) = (1+iep) f(x) (1-iep) = f(x) + ie[0, f]  $L_P = f(x) + e^{ipa} f(x) = \frac{2f}{2x} \Rightarrow \frac{2f}{2x} = i[p, f]$  ie f(p, x) = -i .

Now, in the Heisenberg mitter we have

$$\frac{dp}{dt} = 2 \left[ \frac{p^2}{2m} + V(x), p \right]$$

$$= a \left[ V(x), p \right] = -\frac{\partial V}{\partial x}$$
which is Newton's second law for the operators.

## Section 10.3 ▶

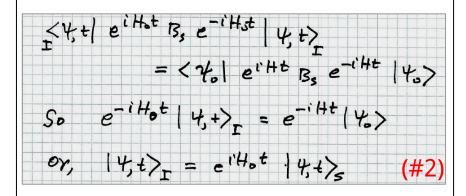

The interaction representation (or, picture)

Now suppose  $H = H_0 + H'$ where H' is a small perturbation of  $H_0$ .

We define, for any observable B,

$$B_{I}(t) = e^{i H_{0} t} B_{S} e^{-i H_{0} t}$$
 (#1)  
(If H'=0 then I.P. is the same as H.P.)

and we require

Or, writing the time evolution in terms of differential equations,

$$i\frac{\partial}{\partial t} | \Psi, t \rangle = e^{iH_0t}(-H_0)e^{-iHt}| \Psi_0 \rangle$$

$$+ e^{iH_0t}(H)e^{-iHt}| \Psi_0 \rangle$$

$$= e^{iH_0t}(H-H_0)e^{-iH_0t}e^{iH_0t}| \Psi, t \rangle,$$

$$= e^{iH_0t}H/e^{-iH_0t}| \Psi, t \rangle_{\mathbb{Z}}$$

$$= H'_{\mathbb{Z}}(t)| \Psi, t \rangle_{\mathbb{Z}} \qquad \text{by Equation (1)}$$
Exercise: Calculate  $\frac{\partial B}{\partial t}$  In  $I$  to interaction picture.

## **Time evolution in perturbation theory**

$$i \stackrel{?}{\Rightarrow} [Y,t] = H'_{\Gamma}(t) |Y,t\rangle_{\Gamma}$$
The solution is  $|Y,t\rangle_{\Gamma} = U_{\Gamma}(t,t_0) |Y,t_0\rangle_{\Gamma}$ 
where
$$U_{\Gamma}(t,t_0) = 1 \exp(-i) \int_{t_0}^{t} H'_{\Gamma}(t') dt' \quad (#3)$$

Proof Assume (3) is true. Then

$$V(t+e,t_0) = V(t+e,t) V(t,t_0)$$

$$= Texp(-i)e H'_{\Gamma}(t) \cdot V_{\Gamma}(t,t_0)$$

$$= [1-ie H'_{\Gamma}(t)] V_{\Gamma}(t,t_0)$$

$$= U(t,t_0) - ie H'_{\Gamma}(t) U_{\Gamma}(t,t_0)$$
Thus  $\frac{\partial U_{\Gamma}}{\partial t} = -i H'_{\Gamma}(t) U_{\Gamma}(t,t_0)$ 

$$\frac{\partial}{\partial t} | \forall_j + \gamma_j = \frac{\partial \mathcal{D}_{\underline{T}}}{\partial t} | \forall_j + \delta_{\underline{T}}$$

$$= -i \quad \forall_{\underline{T}} (t) | \forall_j + \gamma_{\underline{T}}$$

$$= -i \quad \forall_{\underline{T}} (t) | \forall_j + \gamma_{\underline{T}}$$

**QED** 

## **Result**

The time evolution operator, in the interaction picture, is

$$U_{x}(t,t_{0}) = T \exp(-i) \int_{t_{0}}^{t} H_{x}'(t') dt'$$

$$U_{x}(t,t_{0}) = 1 + \sum_{n=1}^{\infty} (-i)^{n} \frac{1}{n!} \int_{t_{0}}^{t} \int_{t_{0}}^{t} dt_{n} \int_{t_{0}}^{t} dt_{n}$$

$$T \left[ H_{x}'(t_{n}) H_{x}'(t_{n}) - ... H_{x}'(t_{n}) \right]$$

That is the same as Eq. (10.38), which is derived by a different method that emphasizes the time-ordered products.

#### THE REST OF CHAPTER 10

Section 10.4 - Symmetries and constants of the motion

(Time reversal symmetry is different; U(T) is anti-linear and anti-unitary.)

- Let X be an observable of the system. The transformation of X is  $X_R = U(R) \times U(R)^{\dagger}$  because then  $\langle RB \mid X_R \mid RA \rangle = \langle B \mid X \mid A \rangle$ .
- Theorem 1. If the Hamiltonian H is invariant, i.e.,  $H_R = H$ , then U(R) is a constant of the motion.

$$H_R = U(R) H U(R)^{\uparrow} = H$$
 $U(R) H = H U(R)$ 

$$[U(R), H] = 0$$

If H is invariant, then we say that R is a symmetry of the system.

■ Theorem 2. If  $\exists$  a continuous group of symmetry transformations, with generators  $K_a$  (a = 1 2 3 ...), then the  $K_a$  are constants of the motion.

## Proof.

The transformation operators are  $U(\theta_a) = \exp \left[ i K_a \theta_a \right]$ 

and theses are symmetry transformations; so,

 $e^{i Ka \theta a} H e^{-i Ka \theta a} = H$ .

Thus  $[K_a, H] = 0$ .

**■** Example:

Translation invariance in spacetime.

Let  $\Pi(x,t)$  be an observable in the Heisenberg picture.

$$\Pi(x,t) = e^{iHt} \Pi(x,0) e^{-iHt}$$

$$= e^{iHt} e^{-iP.x} \Pi(x,0) e^{+iP.x} e^{-iHt}$$

In particular consider a matrix element between energy and momentum eigenstates.

$$\langle E_{2}, P_{2} | \Pi(x,t) | E_{1}, P_{1} \rangle$$
  
= exp{i( (E<sub>2</sub>-E<sub>1</sub>)t - (P<sub>2</sub>-P<sub>1</sub>)x )}<2| $\Pi_{a}$ |1>

What do we learn from this example?
"the matrix element of a local operator between energy
and momentum eigenstates has a characteristic
spacetime dependence"
