

## 2 × 12A Digital Dual Output MicroDlynx™: Non-Isolated DC-DC Power Modules

4.5Vdc –14.4Vdc input; 0.51Vdc to 5.5Vdc output; 2 × 12A Output Current

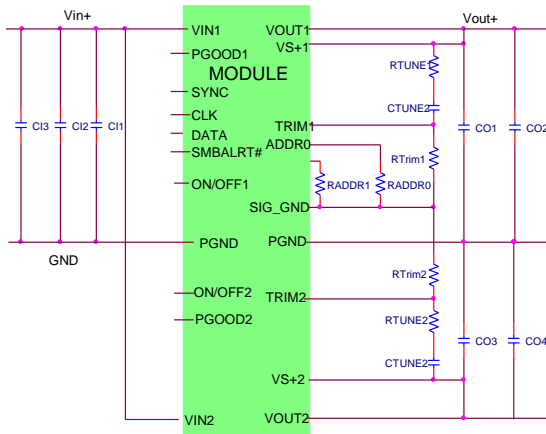

### Features

- Compliant to RoHS II EU "Directive 2011/65/EU"
- Compatible in a Pb-free or SnPb reflow environment
- Compliant to REACH Directive (EC) No 1907/2006
- Compliant to IPC-9592 (September 2008), Category 2, Class II
- Wide Input voltage range (4.5Vdc-14.4Vdc)
- Each Output voltage programmable from 0.6Vdc to 5.5Vdc via external resistor. Digitally adjustable down to 0.51Vdc
- Small size: 20.32 mm × 11.43 mm × 8.5 mm (0.8 in × 0.45 in × 0.335 in)
- Wide operating temperature range -40°C to 85°C
- Digital interface through the PMBus™ # protocol
- Tunable Loop™ to optimize dynamic output voltage response
- Power Good signal for each output
- Fixed switching frequency with capability of external synchronization
- 180° Out-of-phase to reduce input ripple
- Output overcurrent protection (non-latching)
- Output Overvoltage protection
- Over temperature protection
- Remote On/Off
- Ability to sink and source current
- Start up into Pre-biased output
- Cost efficient open frame design
- UL\* 60950-1 2<sup>nd</sup> Ed. Recognized, CSA† C22.2 No. 60950-1-07 Certified, and VDE‡ (EN60950-1 2<sup>nd</sup> Ed.) Licensed
- ISO\*\* 9001 and ISO 14001 certified manufacturing facilities

### Applications

- Distributed power architectures
- Intermediate bus voltage applications
- Telecommunications equipment
- Servers and storage applications
- Networking equipment
- Industrial equipment

### Description

The 2 × 12A Digital Dual MicroDlynx™ power modules are non-isolated dc-dc converters that can deliver up to 2 × 12A of output current. These modules operate over a wide range of input voltage ( $V_{IN} = 4.5\text{Vdc}-14.4\text{Vdc}$ ) and provide precisely regulated output voltages from 0.51Vdc to 5.5Vdc, programmable via an external resistor and PMBus control. Features include a digital interface using the PMBus protocol, remote On/Off, adjustable output voltage, over current and over temperature protection. The PMBus interface supports a range of commands to both control and monitor the module. The module also includes the Tunable Loop™ feature that allows the user to optimize the dynamic response of the converter to match the load with reduced amount of output capacitance leading to savings on cost and PWB area.

## 2 × 12A Digital Dual MicroDlynx™: Non-Isolated DC-DC Power Modules

4.5Vdc –14.4Vdc input; 0.51Vdc to 5.5Vdc output; 2 × 12A Output Current

### Absolute Maximum Ratings

Stresses in excess of the absolute maximum ratings can cause permanent damage to the device. These are absolute stress ratings only, functional operation of the device is not implied at these or any other conditions in excess of those given in the operations sections of the data sheet. Exposure to absolute maximum ratings for extended periods can adversely affect the device reliability.

Parameter	Device	Symbol	Min	Max	Unit
Input Voltage Continuous	All	$V_{IN1}$ and $V_{IN2}$	-0.3	15	V
VS+1, VS+2, SMBALERT#	All		-0.3	7	V
CLK, DATA, SYNC,	All		-0.3	3.6	V
Operating Ambient Temperature (see Thermal Considerations section)	All	$T_A$	-40	85	°C
Storage Temperature	All	$T_{stg}$	-55	125	°C

### Electrical Specifications

Unless otherwise indicated, specifications apply over all operating input voltage, resistive load, and temperature conditions.

Parameter	Device	Symbol	Min	Typ	Max	Unit
Operating Input Voltage	All	$V_{IN1}$ and $V_{IN2}$	4.5	—	14.4	Vdc
Maximum Input Current ( $V_{IN}=4.5V$ to $14.4V$ , $I_O=I_{O,max}$ )	All	$I_{IN1,max}$ & $I_{IN2,max}$			23	Adc
Input No Load Current ( $V_{IN} = 12Vdc$ , $I_O = 0$ , module enabled)	$V_{O,set} = 0.6 Vdc$	$I_{IN1,No\ load}$ & $I_{IN2,No\ load}$		72		mA
	$V_{O,set} = 5.5Vdc$	$I_{IN1,No\ load}$ & $I_{IN2,No\ load}$		210		mA
Input Stand-by Current ( $V_{IN} = 12Vdc$ , module disabled)	All	$I_{IN1,stand-by}$ & $I_{IN2,stand-by}$		14		mA
Inrush Transient	All	$I_1^2t$ & $I_2^2t$			1	A <sup>2</sup> s
Input Reflected Ripple Current, peak-to-peak (5Hz to 20MHz, 1μH source impedance; $V_{IN} = 4.5$ to $14V$ , $I_O = I_{O,max}$ ; See Test Configurations)	All	Both Inputs		25		mAp-p
Input Ripple Rejection (120Hz)	All	Both Inputs		-68		dB

## 2 × 12A Digital Dual MicroDlynx™: Non-Isolated DC-DC Power Modules

4.5Vdc –14.4Vdc input; 0.51Vdc to 5.5Vdc output; 2 × 12A Output Current

### Electrical Specifications (continued)

Parameter	Device	Symbol	Min	Typ	Max	Unit
Output Voltage Set-point (with 0.1% tolerance for external resistor used to set output voltage)	All	VO1, set & VO2, set	-1.0		+1.0	% VO <sub>set</sub>
Output Voltage (Over all operating input voltage, resistive load, and temperature conditions until end of life)	All	Vo1, set & VO2, set	-3.0	—	+3.0	% VO <sub>set</sub>
Adjustment Range (selected by an external resistor) (Some output voltages may not be possible depending on the input voltage – see Feature Descriptions Section) *0.51V possible through PMBus command	All	VO1 & VO2	0.6*		5.5	Vdc

## Design Considerations

### Input Filtering

The 2 × 12A Digital Dual MicroDlynx™ module should be connected to a low ac-impedance source. A highly inductive source can affect the stability of the module. An input capacitance must be placed directly adjacent to the input pin of the module, to minimize input ripple voltage and ensure module stability.

To minimize input voltage ripple, ceramic capacitors are recommended at the input of the module. Figure 37 shows the input ripple voltage for various output voltages at 2 × 12A of load current with 2x22 μF or 3x22 μF ceramic capacitors and an input of 12V.

**Figure 37. Input ripple voltage for various output voltages with 4x22 μF or 6x22 μF ceramic capacitors at the input (2 × 12A load). Input voltage is 12V.**

### Output Filtering

These modules are designed for low output ripple voltage and will meet the maximum output ripple specification with 0.1 μF ceramic and 22 μF ceramic capacitors at the output of the module. However, additional output filtering may be required by the system designer for a number of reasons. First, there may be a need to further reduce the output ripple and noise of the module. Second, the dynamic response characteristics may need to be customized to a particular load step change.

To reduce the output ripple and improve the dynamic response to a step load change, additional capacitance at the output can be used. Low ESR polymer and ceramic capacitors are recommended to improve the dynamic response of the module. Figure 38 provides output ripple information for different external capacitance values at various Vo and a full load current of 2 × 12A. For stable operation of the module, limit the capacitance to less than the maximum output capacitance as specified in the electrical specification table. Optimal performance of the module can be achieved by using the Tunable Loop™ feature described later in this data sheet.

**Figure 38. Output ripple voltage for various output voltages with total external 4x47 μF, 6x47 μF or 8x47 μF ceramic capacitors at the output (2 × 12A load). Input voltage is 12V.**

## Safety Considerations

For safety agency approval the power module must be installed in compliance with the spacing and separation requirements of the end-use safety agency standards, i.e., UL 60950-1 2nd, CSA C22.2 No. 60950-1-07, DIN EN 60950-1:2006 + A11 (VDE0805 Teil 1 + A11):2009-11; EN 60950-1:2006 + A11:2009-03.

For the converter output to be considered meeting the requirements of safety extra-low voltage (SELV), the input must meet SELV requirements. The power module has extra-low voltage (ELV) outputs when all inputs are ELV.

The input to these units is to be provided with a fast-acting fuse with a maximum rating of 30A (voltage rating 125Vac) in the positive input lead. (Littelfuse 456 Series or equivalent)

# 2 × 12A Digital Dual MicroDlynx™: Non-Isolated DC-DC Power Modules

4.5Vdc –14.4Vdc input; 0.51Vdc to 5.5Vdc output; 2 × 12A Output Current

## Analog Feature Descriptions

### Remote On/Off

The module can be turned ON and OFF either by using the ON/OFF pin (Analog interface) or through the PMBus interface (Digital). The module can be configured in a number of ways through the PMBus interface to react to the two ON/OFF inputs:

- Module ON/OFF can be controlled only through the analog interface (digital interface ON/OFF commands are ignored)
- Module ON/OFF can be controlled only through the PMBus interface (analog interface is ignored)
- Module ON/OFF can be controlled by either the analog or digital interface

The default state of the module (as shipped from the factory) is to be controlled by the analog interface only. If the digital interface is to be enabled, or the module is to be controlled only through the digital interface, this change must be made through the PMBus. These changes can be made and written to non-volatile memory on the module so that it is remembered for subsequent use.

### Analog On/Off

The 2 × 12A Digital Dual MicroDlynx™ power modules feature an On/Off pin for remote On/Off operation. Two On/Off logic options are available. In the Positive Logic On/Off option, (device code suffix “4” – see Ordering Information), the module turns ON during a logic High on the On/Off pin and turns OFF during a logic Low. With the Negative Logic On/Off option, (no device code suffix, see Ordering Information), the module turns OFF during logic High and ON during logic Low. The On/Off signal should be always referenced to ground. For either On/Off logic option, leaving the On/Off pin disconnected will turn the module ON when input voltage is present.

For positive logic modules, the circuit configuration for using the On/Off pin is shown in Figure 39. When the external transistor is in the OFF state, the internal transistor Q1 is turned ON, and the internal PWM Enable# signal (normally low) is pulled low causing the module to be ON. When ext. transistor is turned ON, the On/Off pin is pulled low, and the internal PWM Enable# signal (normally low) is pulled high and the module is OFF. For negative logic On/Off modules, the circuit configuration is shown in Fig. 40. When external transistor is in the OFF state, the On/Off pin is pulled high, transistor Q1 is turned ON and the internal PWM Enable signal is pulled low and the module is OFF. To turn the module ON, the external transistor is turned ON pulling the On/Off pin low, turning transistor Q1 OFF resulting in the PWM Enable pin going high and the module turns ON

### Monotonic Start-up and Shutdown

The module has monotonic start-up and shutdown behavior for any combination of rated input voltage, output current and operating temperature range.

### Startup into Pre-biased Output

The module can start into a prebiased output on either or both outputs as long as the prebias voltage is 0.5V less than the set output voltage.

### Analog Output Voltage Programming

The voltage of each output can be programmed to any voltage from 0.6dc to 5.5Vdc by connecting a resistor between the 2 Trims and SIG\_GND pins of the module. Restrictions on the output voltage set point depending on the input voltage are shown in the Output Voltage vs. Input Voltage Set Point Area plot in Fig. 41. The Upper Limit curve shows that for output voltages lower than 1V, the input voltage must be lower than the maximum of 14.4V. When the output voltage is trimmed lower than 0.6V, then the max input voltage shall be reduced by the same factor. Currently the max input voltage for 0.6Vout is 13V. The Lower Limit curve shows that for output voltages higher than 0.6V, the input voltage needs to be larger than the minimum of 4.5V.

Figure 41. Output Voltage vs. Input Voltage Set Point Area plot showing limits where the output voltage can be set for different input voltages.

**Caution** – Do not connect SIG\_GND to GND elsewhere in the layout

Figure 42. Circuit configuration for programming output voltage using an external resistor.

Without an external resistor between Trim and SIG\_GND pins, each output of the module will be 0.6Vdc. To calculate the value of the trim resistor, *Rtrim* for a desired output voltage, should be as per the following equation:

$$R_{trim} = \left[ \frac{12}{(V_o - 0.6)} \right] k\Omega$$

*Rtrim* is the external resistor in kΩ

*Vo* is the desired output voltage.

Table 1 provides *Rtrim* values required for some common output voltages.

Table 1

<i>V<sub>o, set</sub></i> (V)	<i>Rtrim</i> (kΩ)

3.3	4.444
5.0	2.727

### Digital Output Voltage Adjustment

Please see the Digital Feature Descriptions section.

### Remote Sense

The power module has a Remote Sense feature to minimize the effects of distribution losses by regulating the voltage between the sense pins (VS+ and VS-) for each of the 2 outputs. The voltage drop between the sense pins and the VOUT and GND pins of the module should not exceed 0.5V. If there is an inductor being used on the module output, then the tunable loop feature of the module should be used to ensure module stability with the proposed sense point

# 2 × 12A Digital Dual MicroDlynx™: Non-Isolated DC-DC Power Modules

4.5Vdc –14.4Vdc input; 0.51Vdc to 5.5Vdc output; 2 × 12A Output Current

location. If the simulation tools and loop feature of the module are not being used, then the remote sense should always be connected before the inductor. The sense trace should also be kept away from potentially noisy areas of the board

### Analog Voltage Margining

Output voltage margining can be implemented in the module by connecting a resistor,  $R_{margin-up}$ , from the Trim pin to the ground pin for margining-up the output voltage and by connecting a resistor,  $R_{margin-down}$ , from the Trim pin to output pin for margining-down. Figure 43 shows the circuit configuration for output voltage margining. The POL Programming Tool, available at [www.gecriticalpower.com](http://www.gecriticalpower.com) in the Embedded Power group, also calculates the values of  $R_{margin-up}$  and  $R_{margin-down}$  for a specific output voltage and % margin. Please consult your local GE technical representative for additional details.

Figure 43. Circuit Configuration for margining Output voltage.

### Digital Output Voltage Margining

Please see the Digital Feature Descriptions section.

### Overcurrent Protection

To provide protection in a fault (output overload) condition, the unit is equipped with internal current-limiting circuitry on both outputs and can endure current limiting continuously.

At the point of current-limit inception, the unit enters hiccup mode. The unit operates normally once the output current is brought back into its specified range.

### Digital Adjustable Overcurrent Warning

Please see the Digital Feature Descriptions section.

### Overtemperature Protection

To provide protection in a fault condition, the unit is equipped with a thermal shutdown circuit. The unit will shut down if the overtemperature threshold of 135°C(typ) is exceeded at the thermal reference point  $T_{ref}$ . Once the unit goes into thermal shutdown it will then wait to cool before attempting to restart.

### Digital Temperature Status via PMBus

Please see the Digital Feature Descriptions section.

### Digitally Adjustable Output Over and Under Voltage Protection

Please see the Digital Feature Descriptions section.

### Input Undervoltage Lockout

At input voltages below the input undervoltage lockout limit, the module operation is disabled. The module will begin to operate at an input voltage above the undervoltage lockout turn-on threshold.

### Digitally Adjustable Input Undervoltage Lockout

Please see the Digital Feature Descriptions section.

### Digitally Adjustable Power Good Thresholds

Please see the Digital Feature Descriptions section.

### Synchronization

The module switching frequency can be synchronized to a signal with an external frequency within a specified range. Synchronization can be done by using the external signal applied to the SYNC pin of the module as shown in Fig. 45, with the converter being synchronized by the rising edge of the external signal. The Electrical Specifications table specifies the requirements of the external SYNC signal. If the SYNC pin is not used, the module should free run at the default switching frequency. **If synchronization is not being used, connect the SYNC pin to GND.**

Figure 45. External source connections to synchronize switching frequency of the module.

### Measuring Output Current, Output Voltage and Input Voltage

## 2 × 12A Digital Dual MicroDlynx™: Non-Isolated DC-DC Power Modules

4.5Vdc –14.4Vdc input; 0.51Vdc to 5.5Vdc output; 2 × 12A Output Current

Please see the Digital Feature Descriptions section.

### Tunable Loop™

The module has a feature that optimizes transient response of the module called Tunable Loop™.

External capacitors are usually added to the output of the module for two reasons: to reduce output ripple and noise (see Figure 38) and to reduce output voltage deviations from the steady-state value in the presence of dynamic load current changes. Adding external capacitance however affects the voltage control loop of the module, typically causing the loop to slow down with sluggish response. Larger values of external capacitance could also cause the module to become unstable.

The Tunable Loop™ allows the user to externally adjust the voltage control loop to match the filter network connected to the output of the module. The Tunable Loop™ is implemented by connecting a series R-C between the VS+ and TRIM pins of the module, as shown in Fig. 47. This R-C allows the user to externally adjust the voltage loop feedback compensation of the module.

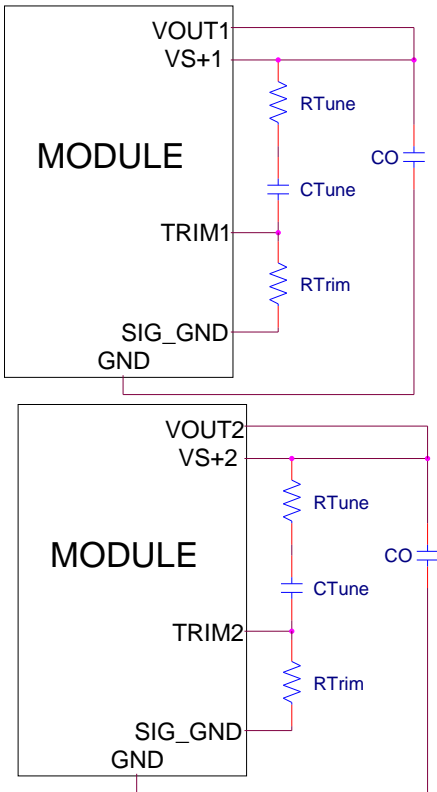

Figure. 47. Circuit diagram showing connection of RTUNE and CTUNE to tune the control loop of the module.

Recommended values of RTUNE and CTUNE for different output capacitor combinations are given in Table 2. Table 2 shows the recommended values of RTUNE and CTUNE for different values of ceramic output capacitors up to 1000uF that might be needed for an application to meet output ripple and noise requirements. Selecting RTUNE and CTUNE according to Table 2 will ensure stable operation of the module. In applications with tight output voltage limits in the presence of dynamic current loading, additional output capacitance will be required. Table 3 lists recommended values of RTUNE and CTUNE in order to meet 2% output voltage deviation limits for some common output voltages in the presence of a 6A to 12A step change (50% of full load), with an input voltage of 12V.

Please contact your GE technical representative to obtain more details of this feature as well as for guidelines on how to select the right value of external R-C to tune the module for best transient performance and stable operation for other output capacitance values.

Table 2. General recommended values of RTUNE and CTUNE for Vin=12V and various external ceramic capacitor combinations.

Co	3x47µF	4x47µF	6x47µF	10x47µF	20x47µF
RTUNE	300	300	300	300	300
CTUNE	220pF	330pF	1000pF	1800pF	3900pF

Table 3. Recommended values of RTUNE and CTUNE to obtain transient deviation of 2% of Vout for a 6A step load with Vin=12V.

Vo	5V	3.3V	2.5V	1.8V	1.2V	0.6V
Co	6x47µF	3x47µF + 330µF Polymer	3x47µF + 2x330µF Polymer	3x47µF + 2x330µF Polymer	3x47µF + 3x330µF Polymer	2x47µF + 7x330µF Polymer
RTUNE	300	300	300	300	300	300
CTUNE	470pF	1200pF	1500pF	1800pF	2700pF	12nF
ΔV	84mV	39mV	30mV	27mV	20mV	10mV

Note: The capacitors used in the Tunable Loop tables are 47 µF/2 mΩ ESR ceramic and 330 µF/12 mΩ ESR polymer capacitors.

## Digital Feature Descriptions

### PMBus Interface Capability

The 2 × 12A Digital Dual MicroDlynx™ power modules have a PMBus interface that supports both communication and control. The PMBus Power Management Protocol Specification can be obtained from [www.pmbus.org](http://www.pmbus.org). The modules support a subset of version 1.1 of the specification (see Table 6 for a list of the specific commands supported). Most module parameters can be programmed using PMBus and stored as defaults for later use.

All communication over the module PMBus interface must support the Packet Error Checking (PEC) scheme. The PMBus master must generate the correct PEC byte for all transactions, and check the PEC byte returned by the module.

The module also supports the SMBALERT# response protocol whereby the module can alert the bus master if it wants to talk. For more information on the SMBus alert response protocol, see the System Management Bus (SMBus) specification.

The module has non-volatile memory that is used to store configuration settings. Not all settings programmed into the device are automatically saved into this non-volatile memory, only those specifically identified as capable of being stored can be saved (see Table 6 for which command parameters can be saved to non-volatile storage).

### PMBus Data Format

For commands that set thresholds, voltages or report such quantities, the module supports the “Linear” data format among the three data formats supported by PMBus. The Linear Data Format is a two byte value with an 11-bit, two’s complement mantissa and a 5-bit, two’s complement exponent. The format of the two data bytes is shown below:

The value of the number is then given by  

$$\text{Value} = \text{Mantissa} \times 2^{\text{Exponent}}$$

### PMBus Addressing

The power module can be addressed through the PMBus using a device address. The module has 64 possible addresses (0 to 63 in decimal) which can be set using resistors connected from the ADDR0 and ADDR1 pins to SIG\_GND. Note that some of these addresses (0, 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 40, 44, 45, 55 in decimal) are reserved according to the SMBus specifications and may not be useable. The address is set in the form of two octal (0 to 7) digits, with each pin setting one digit. The ADDR1 pin sets the high order digit and ADDR0 sets the low order digit. The resistor values suggested for each digit are shown in Table 4 (1% tolerance resistors are recommended). Note that if

either address resistor value is outside the range specified in Table 4, the module will respond to address 127.

Table 4

Digit	Resistor Value (KΩ)
0	11
1	18.7
2	27.4
3	38.3
4	53.6
5	82.5
6	127
7	187

The user must know which I<sup>2</sup>C addresses are reserved in a system for special functions and set the address of the module to avoid interfering with other system operations. Both 100kHz and 400kHz bus speeds are supported by the module. Connection for the PMBus interface should follow the High Power DC specifications given in section 3.1.3 in the SMBus specification V2.0 for the 400kHz bus speed or the Low Power DC specifications in section 3.1.2. The complete SMBus specification is available from the SMBus web site, [smbus.org](http://smbus.org).

Figure 48. Circuit showing connection of resistors used to set the PMBus address of the module.

### PAGE

Both the outputs of the module can be configured, controlled and monitored through only one physical address

Format	Unsigned Binary							
Bit Position	7	6	5	4	3	2	1	0
Access	r/w	r	r	r	r	r	r	r/w
Function	PA	X	X	X	X	X	X	P0
Default Value	0	X	X	X	X	X	X	0

### PAGE Command Truth Table

PA	P0	Logic Results
0	0	All Commands address first output
0	1	All Commands address second output
1	0	Illegal input, Ignore write
1	1	All Commands address both outputs

If PAGE=11, then any read commands affect the first channel. Any value to ready-only registers is ignored.

# 2 × 12A Digital Dual MicroDlynx™: Non-Isolated DC-DC Power Modules

4.5Vdc –14.4Vdc input; 0.51Vdc to 5.5Vdc output; 2 × 12A Output Current

### Operation (01h)

This is a paged register. The OPERATION command can be used to turn the module on or off in conjunction with the ON/OFF pin input. It is also used to margin up or margin down the output voltage

### PMBus Enabled On/Off

The module can also be turned on and off via the PMBus interface. The OPERATION command is used to actually turn the module on and off via the PMBus, while the ON\_OFF\_CONFIG command configures the combination of analog ON/OFF pin input and PMBus commands needed to turn the module on and off. Bit [7] in the OPERATION command data byte enables the module, with the following functions:

- 0 : Output is disabled
- 1 : Output is enabled

This module uses the lower five bits of the ON\_OFF\_CONFIG data byte to set various ON/OFF options as follows:

Bit Position	4	3	2	1	0
Access	r/w	r/w	r/w	r	r
Function	PU	CMD	CPR	POL	CPA
<b>Default Value</b>	<b>1</b>	<b>0</b>	<b>1</b>	<b>1</b>	<b>0</b>

PU: Sets the default to either operate any time input power is present or for the ON/OFF to be controlled by the analog ON/OFF input and the PMBus OPERATION command. This bit is used together with the CP, CMD and ON bits to determine startup.

Bit Value	Action
0	Module powers up any time power is present regardless of state of the analog ON/OFF pin
1	Module does not power up until commanded by the analog ON/OFF pin and the OPERATION command as programmed in bits [2:0] of the ON_OFF_CONFIG register.

CMD: The CMD bit controls how the device responds to the OPERATION command.

Bit Value	Action
0	Module ignores the ON bit in the OPERATION command
1	Module responds to the ON bit in the OPERATION command

CPR: Sets the response of the analog ON/OFF pin. This bit is used together with the CMD, PU and ON bits to determine startup.

Bit Value	Action
-----------	--------

0	Module ignores the analog ON/OFF pin, i.e. ON/OFF is only controlled through the PMBUS via the OPERATION command
1	Module requires the analog ON/OFF pin to be asserted to start the unit

CPA: Sets the action of the analog ON/OFF pin when turning the controller OFF. This bit is internally read and cannot be modified by the user

### PMBus Adjustable Soft Start Rise Time

The soft start rise time can be adjusted in the module via PMBus. When setting this parameter, make sure that the charging current for output capacitors can be delivered by the module in addition to any load current to avoid nuisance tripping of the overcurrent protection circuitry during startup. The TON\_RISE command sets the rise time in ms, and allows choosing soft start times between 600µs and 9ms, with possible values listed in Table 5. Note that the exponent is fixed at -4 (decimal) and the upper two bits of the mantissa are also fixed at 0.

Table 5

Rise Time	Exponent	Mantissa
600µs	11100	00000001010
900µs	11100	00000001110
1.2ms	11100	00000010011
1.8ms	11100	00000011101
2.7ms	11100	00000101011
4.2ms	11100	00001000011
6.0ms	11100	00001100000
9.0ms	11100	00010010000

### Output Voltage Adjustment Using the PMBus

The VREF\_TRIM parameter is important for a number of PMBus commands related to output voltage trimming, and margining. Each of the 2 output voltages of the module can be set as the combination of the voltage divider formed by RTrim and a 20kΩ upper divider resistor inside the module, and the internal reference voltage of the module. The reference voltage VREF is nominally set at 600mV, and the output regulation voltage is then given by

$$V_{OUT.1} = \left[ \frac{20000 + RTrim1}{RTrim1} \right] \times V_{REF}$$

$$V_{OUT.2} = \left[ \frac{20000 + RTrim2}{RTrim2} \right] \times V_{REF}$$

Hence the module output voltages is dependent on the value of RTrim1 and Rtrim2 which are connected external to the module.

The VREF\_TRIM parameter is used to apply a fixed offset voltage to the reference voltage can be specified using the "Linear" format and two bytes. The exponent is fixed at -9 (decimal). The resolution of the adjustment is 7 bits, with a

## 2 × 12A Digital Dual MicroDlynx™: Non-Isolated DC-DC Power Modules

### 4.5Vdc –14.4Vdc input; 0.51Vdc to 5.5Vdc output; 2 × 12A Output Current

resulting step size of approximately 0.4%. The maximum trim range is -20% to +10% of the nominal reference voltage (600mV) in 2mV steps. Possible values range from -120mV to +60mV. The exception is at 0.6V<sub>out</sub> where the allowable trim range is only -90mV to +60mV to prevent the module from operating at lower than 0.51Vdc. When trimming the voltage below 0.6V, the module max. input voltage operating point also reduces proportionally. As shown earlier in Fig.41, the maximum permissible input voltage is 13V. For any voltage trimmed below 0.6V, the maximum input voltage will have to be reduced by the same factor.

When PMBus commands are used to trim or margin the output voltage, the value of  $V_{REF}$  is what is changed inside the module, which in turn changes the regulated output voltage of the module.

The nominal output voltage of the module is adjustable with a minimum step size of 0.4% over a +10% to -20% range from nominal using the  $V_{REF\_TRIM}$  command over the PMBus.

The  $V_{REF\_TRIM}$  command can be used to apply a fixed offset voltage to either of the output voltage command value using the "Linear" mode with the exponent fixed at -9 (decimal). The value of the offset voltage is given by

$$V_{REF(offset)} = V_{REF\_TRIM} \times 2^{-9}$$

This offset voltage is added to the voltage set through the divider ratio and nominal  $V_{REF}$  to produce the trimmed output voltage. If a value outside of the +10%/-20% adjustment range is given with this command, the module will set its output voltage to the upper or lower limit value (as if  $V_{OUT\_TRIM}$ ,  $assert\_SMBALRT\#$ , set the  $CML$  bit in  $STATUS\_BYTE$  and the invalid data bit in  $STATUS\_CML$ ).

#### Applications Example

For a design where the output voltage is 1.8V and the output needs to be trimmed down by 20mV.

- The internal reference voltage is 0.6V. So we need to determine how the 20mV translates to a change in the internal reference voltage.
- Divider Ratio =  $V_{ref}/V_{out} = 0.6/1.8 = 0.33$
- Hence a 20mV change at 1.8V<sub>o</sub> requires a  $0.33 \times 20\text{mV} = 6.6\text{mV}$  change in the reference voltage.
- $V_{ref(offset)} = -(6.6)/1000 = -0.0066$  Volts (- sign since we are trimming down)
- $V_{ref(offset)} = V_{ref\_Trim} \times 2^{-9}$
- $V_{ref\_Trim} = V_{ref(offset)} \times 512$
- $V_{ref\_Trim} = -0.0066 \times 512 = -3.3 = -3$  (rounded to nearest integer)

#### Output Voltage Margining Using the PMBus

Each output of the module can also have its output voltage margined via PMBus commands. The command  $STEP\_VREF\_MARGIN\_HIGH$  will set the margin high voltage, while the command  $STEP\_VREF\_MARGIN\_LOW$  sets the margin low voltage. Both the  $STEP\_VREF\_MARGIN\_HIGH$  and  $STEP\_VREF\_MARGIN\_LOW$  commands will use the "Linear" mode with the exponent fixed at -9 (decimal). Two bytes are used for the mantissa with the upper bit [7] of the

high byte fixed at 0. The actual margined output voltage is a combination of the  $STEP\_VREF\_MARGIN\_HIGH$  or  $STEP\_VREF\_MARGIN\_LOW$  and the  $V_{REF\_TRIM}$  values as shown below. The net permissible voltage range change is -30% to +10% for the margin high command and -20% to 0% for the margin low command

$$V_{REF(MH)} = (STEP\_VREF\_MARGIN\_HIGH + V_{REF\_TRIM}) \times 2^{-9}$$

#### Applications Example

For a design where the output voltage is 1.2V and the output needs to be trimmed up by 100mV (within 10% of  $V_o$ ).

- The internal reference voltage is 0.6V. So we need to determine how the 100mV translates to a change in the internal reference voltage.
- Divider Ratio =  $V_{ref}/V_{out} = 0.6/1.2 = 0.5$
- Hence a 100mV change at 1.2V<sub>o</sub> requires a  $0.5 \times 100\text{mV} = 50\text{mV}$  change in the reference voltage.
- $V_{REF(MH)} = (50)/1000 = 0.05$  Volts
- $V_{REF(MH)} = (STEP\_V_{ref\_margin\_high} + V_{ref\_trim}) \times 2^{-9}$
- Assume  $V_{ref\_Trim} = 0$  here
- $STEP\_V_{ref\_margin\_high} = V_{REF(MH)} \times 512$
- $STEP\_V_{ref\_margin\_high} = 0.05 \times 512 = 26$  (rounded to nearest integer)

$$V_{REF(ML)} =$$

$$(STEP\_VREF\_MARGIN\_LOW + V_{REF\_TRIM}) \times 2^{-9}$$

#### Applications Example

For a design where the output voltage is 1.8V and the output needs to be trimmed down by 100mV (within -20% of  $V_o$ ).

- The internal reference voltage is 0.6V. So we need to determine how the 100mV translates to a change in the internal reference voltage.
- Divider Ratio =  $V_{ref}/V_{out} = 0.6/1.8 = 0.33$
- Hence a 100mV change at 1.8V<sub>o</sub> requires a  $0.33 \times 100\text{mV} = 33\text{mV}$  change in the reference voltage.
- $V_{REF(ML)} = -(33)/1000 = -0.033$  Volts (- sign since we are margining down)
- $V_{REF(ML)} = (STEP\_V_{ref\_margin\_low} + V_{ref\_trim}) \times 2^{-9}$
- Assume  $V_{ref\_Trim} = -3$  here (from  $V_{ref\_Trim}$  example earlier)
- $STEP\_V_{ref\_margin\_low} = V_{REF(ML)} \times 512 - V_{ref\_trim}$
- $STEP\_V_{ref\_margin\_low} = -0.033 \times 512 - (-3) = -16.9 + 3 = -13.9 = -14$  (rounded to nearest integer)

The module will support the margined high or low voltages using the OPERATION command. Bits [5:2] are used to enable margining as follows:

00XX	: Margin Off
0101	: Margin Low (Act on Fault)
0110	: Margin Low (Act on Fault)
1001	: Margin High (Act on Fault)
1010	: Margin High (Act on Fault)

#### PMBus Adjustable Overcurrent Warning

The module can provide an overcurrent warning via the PMBus. The threshold for the overcurrent warning can be set using the parameter  $IOUT\_OC\_WARN\_LIMIT$ . This

## 2 × 12A Digital Dual MicroDlynx™: Non-Isolated DC-DC Power Modules

### 4.5Vdc –14.4Vdc input; 0.51Vdc to 5.5Vdc output; 2 × 12A Output Current

command uses the “Linear” data format with a two byte data word where the upper five bits [7:3] of the high byte represent the exponent and the remaining three bits of the high byte [2:0] and the eight bits in the low byte represent the mantissa. The exponent is fixed at -1 (decimal). The upper five bits of the mantissa are fixed at 0 while the lower six bits are programmable with a default value of 19A (decimal). The resolution of this warning limit is 500mA. The value of the IOUT\_OC\_WARN\_LIMIT can be stored to non-volatile memory using the STORE\_DEFAULT\_ALL command.

#### Temperature Status via PMBus

The module will provide information related to temperature of the module through the READ\_TEMPERATURE\_2 command. The command returns external temperature in degrees Celsius. This command will use the “Linear” data format with a two byte data word where the upper five bits [7:3] of the high byte will represent the exponent and the remaining three bits of the high byte [2:0] and the eight bits in the low byte will represent the mantissa. The exponent is fixed at 0 (decimal). The lower 11 bits are the result of the ADC conversion of the external temperature

#### PMBus Adjustable Output Over, Under Voltage Protection and Power Good

The module has a common command to set the PGOOD, VOUT\_UNDER\_VOLTAGE(UV) and VOUT\_OVER\_VOLTAGE(OV) limits as a percentage of nominal. Refer to Table 6 of the next section for the available settings. The PMBus command VOUT\_OVER\_VOLTAGE(OV) is used to set the output over voltage threshold from two possible values: +12.5% or +16.67% of the commanded output voltage for each output.

The module provides a Power Good (PGOOD) for each output signal that is implemented with an open-drain output to indicate that the output voltage is within the regulation limits of the power module. The PGOOD signal is de-asserted to a low state if any condition such as overtemperature, overcurrent or loss of regulation occurs that would result in the output voltage going outside the specified thresholds. The PGOOD thresholds are user selectable via the PMBus (the default values are as shown in the Feature Specifications Section). Each threshold is set up symmetrically above and below the nominal value. The PGL (POWERGOODLOW) command will set the output voltage level above which PGOOD is asserted (lower threshold). The PGH(POWERGOODHIGH) command will set the level above which the PGOOD command is de-asserted. This command will also set two thresholds symmetrically placed around the nominal output voltage. Normally, the PGL threshold is set higher than the PGH threshold.

The PGOOD terminal can be connected through a pullup resistor (suggested value 100KΩ) to a source of 5VDC or lower. The current through the PGood terminal should be limited to a max value of 5mA

#### PMBus Adjustable Input Undervoltage Lockout

The module allows for adjustment of the input under voltage lockout and hysteresis. The command VIN\_ON allows setting the input voltage turn on threshold for each output, while the VIN\_OFF command will set the input voltage turn off

threshold. For the VIN\_ON command, possible values are 4.25V to 16V in variable steps. For the VIN\_OFF command, possible values are 4V to 15.75V in 0.5V steps. If other values are entered for either command, they is mapped to the closest of the allowed values.

Both the VIN\_ON and VIN\_OFF commands use the “Linear” format with two data bytes. The upper five bits will represent the exponent (fixed at -2) and the remaining 11 bits will represent the mantissa. For the mantissa, the four most significant bits are fixed at 0.

#### Measurement of Output Current, Output Voltage and Input Voltage

The module is capable of measuring key module parameters such as output current and voltage for each outputs and input voltage for each input and providing this information through the PMBus interface.

#### Measuring Output Current Using the PMBus

The module measures current by using the inductor winding resistance as a current sense element. The inductor winding resistance is then the current gain factor used to scale the measured voltage into a current reading. This gain factor is the argument of the IOUT\_CAL\_GAIN command, and consists of two bytes in the linear data format. The exponent uses the upper five bits [7:3] of the high data byte in two's complement format and is fixed at -15 (decimal). The remaining 11 bits in two's complement binary format represent the mantissa. During manufacture, each module is calibrated by measuring and storing the current gain factor into non-volatile storage.

The current measurement accuracy is also improved by each module being calibrated during manufacture with the offset in the current reading. The IOUT\_CAL\_OFFSET command is used to store and read the current offset. The argument for this command consists of two bytes composed of a 5-bit exponent (fixed at -4d) and a 11-bit mantissa. This command has a resolution of 62.5mA and a range of -4000mA to +3937.5mA.

The READ\_IOUT command provides module average output current information. This command only supports positive or current sourced from the module. If the converter is sinking current a reading of 0 is provided. The READ\_IOUT command returns two bytes of data in the linear data format. The exponent uses the upper five bits [7:3] of the high data byte in two's complement format and is fixed at -4 (decimal). The remaining 11 bits in two's complement binary format represent the mantissa with the 11<sup>th</sup> bit fixed at 0 since only positive numbers are considered valid.

#### Measuring Output Voltage Using the PMBus

The module provides output voltage information using the READ\_VOUT command for each output. In this module the output voltage is sensed at the remote sense amplifier output pin so voltage drop to the load is not accounted for. The command will return two bytes of data all representing the mantissa while the exponent is fixed at -9 (decimal).

## 2 × 12A Digital Dual MicroDlynx™: Non-Isolated DC-DC Power Modules

4.5Vdc –14.4Vdc input; 0.51Vdc to 5.5Vdc output; 2 × 12A Output Current

### Reading the Status of the Module using the PMBus

The module supports a number of status information commands implemented in PMBus. However, not all features are supported in these commands. A 1 in the bit position indicates the fault that is flagged.

**STATUS\_BYTE** : Returns one byte of information with a summary of the most critical device faults.

Bit Position	Flag	Default Value
7	X	0
6	OFF	0
5	VOUT Overvoltage	0
4	IOUT Overcurrent	0
3	VIN Undervoltage	0
2	Temperature	0
1	CML (Comm. Memory Fault)	0
0	None of the above	0

**STATUS\_WORD** : Returns two bytes of information with a summary of the module's fault/warning conditions.

#### Low Byte

Bit Position	Flag	Default Value
7	X	0
6	OFF	0
5	VOUT Overvoltage	0
4	IOUT Overcurrent	0
3	VIN Undervoltage	0
2	Temperature	0
1	CML (Comm. Memory Fault)	0
0	None of the above	0

#### High Byte

Bit Position	Flag	Default Value
7	VOUT fault or warning	0
6	IOUT fault or warning	0
5	X	0
4	MFR	0
3	POWER_GOOD# (is negated)	0
2	X	0
1	X	0
0	X	0

**STATUS\_VOUT** : Returns one byte of information relating to the status of the module's output voltage related faults.

Bit Position	Flag	Default Value
7	VOUT OV Fault	0
6	X	0
5	X	0
4	VOUT UV Fault	0
3	X	0
2	X	0
1	X	0
0	X	0

**STATUS\_IOUT** : Returns one byte of information relating to the status of the module's output voltage related faults.

Bit Position	Flag	Default Value
7	IOUT OC Fault	0
6	X	0
5	IOUT OC Warning	0
4	X	0
3	X	0
2	X	0
1	X	0
0	X	0

**STATUS\_TEMPERATURE** : Returns one byte of information relating to the status of the module's temperature related faults.

Bit Position	Flag	Default Value
7	OT Fault	0
6	OT Warning	0
5	X	0
4	X	0
3	X	0
2	X	0
1	X	0
0	X	0

**STATUS\_CML** : Returns one byte of information relating to the status of the module's communication related faults.

Bit Position	Flag	Default Value
7	Invalid/Unsupported Command	0
6	Invalid/Unsupported Command	0
5	Packet Error Check Failed	0
4	Memory Fault Detected	0
3	X	0
2	X	0
1	Other Communication Fault	0
0	X	0

**MFR\_VIN\_MIN** : Returns minimum input voltage as two data bytes of information in Linear format (upper five bits are exponent – fixed at -2, and lower 11 bits are mantissa in two's complement format – fixed at 12)

**MFR\_VOUT\_MIN** : Returns minimum output voltage as two data bytes of information in Linear format (upper five bits are exponent – fixed at -10, and lower 11 bits are mantissa in two's complement format – fixed at 614)

**MFR\_SPECIFIC\_00** : Returns information related to the type of module and revision number. Bits [7:2] in the Low Byte indicate the module type (xxxxxx corresponds to the UDXS1212 series of module), while bits [7:3] indicate the revision number of the module.

#### Low Byte

Bit Position	Flag	Default Value
--------------	------	---------------

2 × 12A Digital Dual MicroDlynx™: Non-Isolated DC-DC Power Modules  
 4.5Vdc -14.4Vdc input; 0.51Vdc to 5.5Vdc output; 2 × 12A Output Current

7:2	Module Name	000011
1:0	Reserved	10

**High Byte**

Bit Position	Flag	Default Value
7:3	Module Revision Number	None
2:0	Reserved	000

## 2 × 12A Digital Dual MicroDlynx™: Non-Isolated DC-DC Power Modules

4.5Vdc –14.4Vdc input; 0.51Vdc to 5.5Vdc output; 2 × 12A Output Current

### Summary of Supported PMBus Commands

Please refer to the PMBus 1.1 specification for more details of these commands.

# 2 × 12A Digital Dual MicroDlynx™: Non-Isolated DC-DC Power Modules

4.5Vdc –14.4Vdc input; 0.51Vdc to 5.5Vdc output; 2 × 12A Output Current

## Thermal Considerations

Power modules operate in a variety of thermal environments; however, sufficient cooling should always be provided to help ensure reliable operation.

Considerations include ambient temperature, airflow, module power dissipation, and the need for increased reliability. A reduction in the operating temperature of the module will result in an increase in reliability. The thermal data presented here is based on physical measurements taken in a wind tunnel. The test set-up is shown in Figure 49. The preferred airflow direction for the module is in Figure 50.

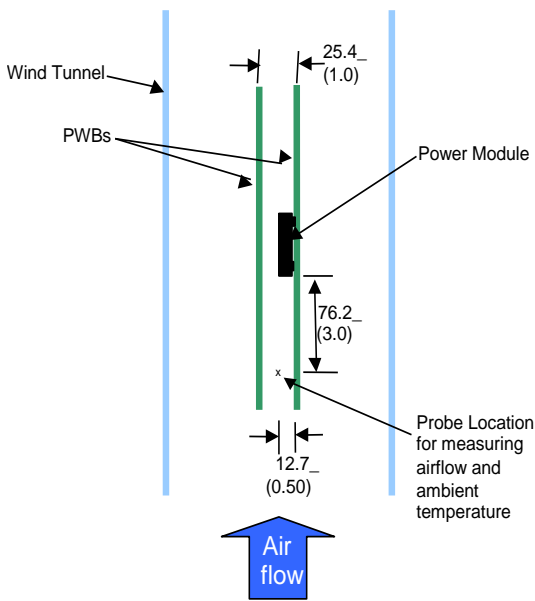

Figure 49. Thermal Test Setup.

The thermal reference points,  $T_{ref}$  used in the specifications are also shown in Figure 50. For reliable operation the temperatures at these points should not exceed 135°C. The output power of the module should not exceed the rated power of the module ( $V_{o,set} \times I_{o,max}$ ).

Please refer to the Application Note “Thermal Characterization Process For Open-Frame Board-Mounted Power Modules” for a detailed discussion of thermal aspects including maximum device temperatures.

Figure 50. Preferred airflow direction and location of hot-spot of the module ( $T_{ref}$ ).

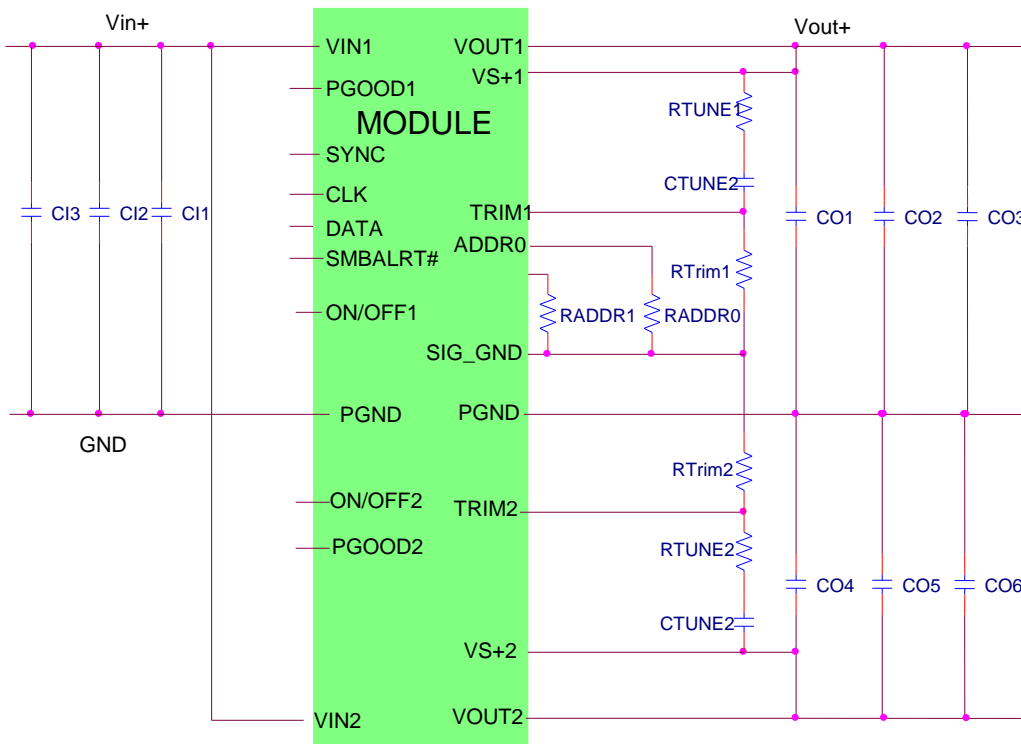

## 2 × 12A Digital Dual MicroDlynx™: Non-Isolated DC-DC Power Modules

4.5Vdc –14.4Vdc input; 0.51Vdc to 5.5Vdc output; 2 × 12A Output Current

### Example Application Circuit

#### Requirements:

Vin:	12V
Vout:	1.8V
Iout:	2 × 9A max., worst case load transient is from 6A to 9A
ΔVout:	1.5% of Vout (27mV) for worst case load transient
Vin, ripple	1.5% of Vin (180mV, p-p)

C1	Decoupling cap - 4x0.1μF/16V, 0402 size ceramic capacitor
C2	4x22μF/16V ceramic capacitor (e.g. Murata GRM32ER61C226KE20)
C3	470μF/16V bulk electrolytic
CO1	Decoupling cap - 2x0.1μF/16V, 0402 size ceramic capacitor
CO2	3 × 47μF/6.3V ceramic capacitor (e.g. Murata GRM31CR60J476ME19)
CO3	1 × 330μF/6.3V Polymer (e.g. Sanyo Poscap)
CO4	Decoupling cap - 2x0.1μF/16V, 0402 size ceramic capacitor
CO5	3 × 47μF/6.3V ceramic capacitor (e.g. Murata GRM31CR60J476ME19)
CO6	1 × 330μF/6.3V Polymer (e.g. Sanyo Poscap)
CTune1	1200pF ceramic capacitor (can be 1206, 0805 or 0603 size)
RTune1	300 ohms SMT resistor (can be 1206, 0805 or 0603 size)
RTrim1	10kΩ SMT resistor (can be 1206, 0805 or 0603 size, recommended tolerance of 0.1%)
CTune2	1200pF ceramic capacitor (can be 1206, 0805 or 0603 size)
RTune2	300 ohms SMT resistor (can be 1206, 0805 or 0603 size)
RTrim2	10kΩ SMT resistor (can be 1206, 0805 or 0603 size, recommended tolerance of 0.1%)

**Note:** The DATA, CLK and SMBALRT pins do not have any pull-up resistors inside the module. Typically, the SMBus master controller will have the pull-up resistors as well as provide the driving source for these signals.

# 2 × 12A Digital Dual MicroDlynx™: Non-Isolated DC-DC Power Modules

4.5Vdc –14.4Vdc input; 0.51Vdc to 5.5Vdc output; 2 × 12A Output Current

## Packaging Details

The 12V Digital Dual MicroDlynx™ 2 × 12A modules are supplied in tape & reel as standard. Modules are shipped in quantities of 200 modules per reel.

All Dimensions are in millimeters and (in inches).

Reel Dimensions:	
Outside Dimensions:	330.2 mm (13.00)
Inside Dimensions:	177.8 mm (7.00")
Tape Width:	44.00 mm (1.732")

## 2 × 12A Digital Dual MicroDlynx™: Non-Isolated DC-DC Power Modules

4.5Vdc –14.4Vdc input; 0.51Vdc to 5.5Vdc output; 2 × 12A Output Current

### Surface Mount Information

#### Pick and Place

The 2 × 12A Digital Dual MicroDlynx™ modules use an open frame construction and are designed for a fully automated assembly process. The modules are fitted with a label designed to provide a large surface area for pick and place operations. The label meets all the requirements for surface mount processing, as well as safety standards, and is able to withstand reflow temperatures of up to 300°C. The label also carries product information such as product code, serial number and the location of manufacture.

#### Nozzle Recommendations

The module weight has been kept to a minimum by using open frame construction. Variables such as nozzle size, tip style, vacuum pressure and placement speed should be considered to optimize this process. The minimum recommended inside nozzle diameter for reliable operation is 3mm. The maximum nozzle outer diameter, which will safely fit within the allowable component spacing, is 7 mm.

#### Bottom Side / First Side Assembly

This module is not recommended for assembly on the bottom side of a customer board. If such an assembly is attempted, components may fall off the module during the second reflow process.

#### Lead Free Soldering

The modules are lead-free (Pb-free) and RoHS compliant and fully compatible in a Pb-free soldering process. Failure to observe the instructions below may result in the failure of or cause damage to the modules and can adversely affect long-term reliability.

#### Pb-free Reflow Profile

Power Systems will comply with J-STD-020 Rev. D (Moisture/Reflow Sensitivity Classification for Nonhermetic Solid State Surface Mount Devices) for both Pb-free solder profiles and MSL classification procedures. This standard provides a recommended forced-air-convection reflow profile based on the volume and thickness of the package (table 4-2). The suggested Pb-free solder paste is Sn/Ag/Cu (SAC). The recommended linear reflow profile using Sn/Ag/Cu solder is shown in Fig. 50. Soldering outside of the recommended profile requires testing to verify results and performance.

#### MSL Rating

The 2 × 12A Digital Dual MicroDlynx™ modules have a MSL rating of 3

#### Storage and Handling

The recommended storage environment and handling procedures for moisture-sensitive surface mount packages is detailed in J-STD-033 Rev. A (Handling, Packing, Shipping and Use of Moisture/Reflow Sensitive Surface Mount Devices). Moisture barrier bags (MBB) with desiccant are required for MSL ratings of 2 or greater. These sealed

packages should not be broken until time of use. Once the original package is broken, the floor life of the product at conditions of  $\leq 30^{\circ}\text{C}$  and 60% relative humidity varies according to the MSL rating (see J-STD-033A). The shelf life for dry packed SMT packages will be a minimum of 12 months from the bag seal date, when stored at the following conditions:  $< 40^{\circ}\text{C}$ ,  $< 90\%$  relative humidity.

Figure 51. Recommended linear reflow profile using Sn/Ag/Cu solder.

#### Post Solder Cleaning and Drying Considerations

Post solder cleaning is usually the final circuit-board assembly process prior to electrical board testing. The result of inadequate cleaning and drying can affect both the reliability of a power module and the testability of the finished circuit-board assembly. For guidance on appropriate soldering, cleaning and drying procedures, refer to *Board Mounted Power Modules: Soldering and Cleaning* Application Note (AN04-001).

## 2 × 12A Digital Dual MicroDlynx™: Non-Isolated DC-DC Power Modules

4.5Vdc – 14.4Vdc input; 0.51Vdc to 5.5Vdc output; 2 × 12A Output Current

### Ordering Information

Please contact your GE Sales Representative for pricing, availability and optional features.

**Table 9. Device Codes**

Device Code	Input Voltage Range	Output Voltage	Output Current	On/Off Logic	Sequencing	Comcodes
UDXS1212A0X3-SRZ	4.5 – 14.4Vdc	0.51 – 5.5 Vdc	12Ax2	Negative	No	150026732
UDXS1212A0X43-SRZ	4.5 – 14.4Vdc	0.51 – 5.5 Vdc	12Ax2	Positive	No	150033761

**Table 10. Coding Scheme**

Package Identifier	Family	Sequencing Option	Input Voltage	Output current	Output voltage	On/Off logic	Remote Sense	Options	ROHS Compliance
<b>U</b>	<b>D</b>	<b>X</b>	<b>S</b>	<b>1212A0</b>	<b>X</b>		<b>3</b>	<b>-SR</b>	<b>Z</b>
P=Pico U=Micro M=Mega G=Giga	D=Dlynx Digital V = DLynx Analog.	T=with EZ Sequence X=without sequencing	Special: 4.5 – 14V	2 × 12A	X = programmable output	4 = positive No entry = negative	3 = Remote Sense	S = Surface Mount R = Tape & Reel	Z = ROHS6
