

LAPP IPMC Hardware

IPMC Serial Port

IOIF Serial Port

IPMC Test Board Setup

The IPMC has 2 micro-controllers called IOIF and IPMC

Each micro-controller has an internal flash memory for storing the firmware and One Time Programming memory for storing permanent information

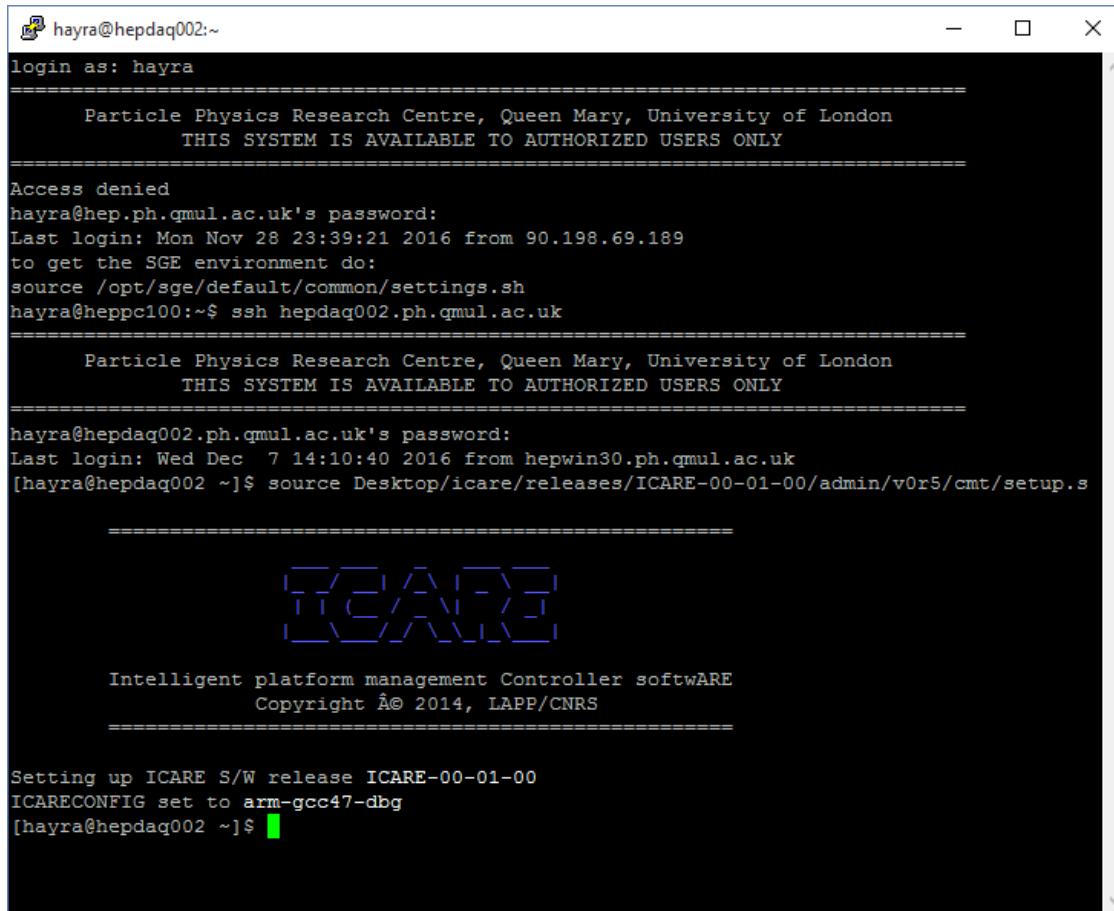

There is also an external flash memory which is accessible by the two micro-controllers through a CPLD

PC communicates with the IPMC through the IPMC JTAG chain and through the serial port of each micro-controller on the IPMC

New firmware (version 5.2) allows Ethernet access to JTAG chain

Two PC required to program IPMC using Test Board

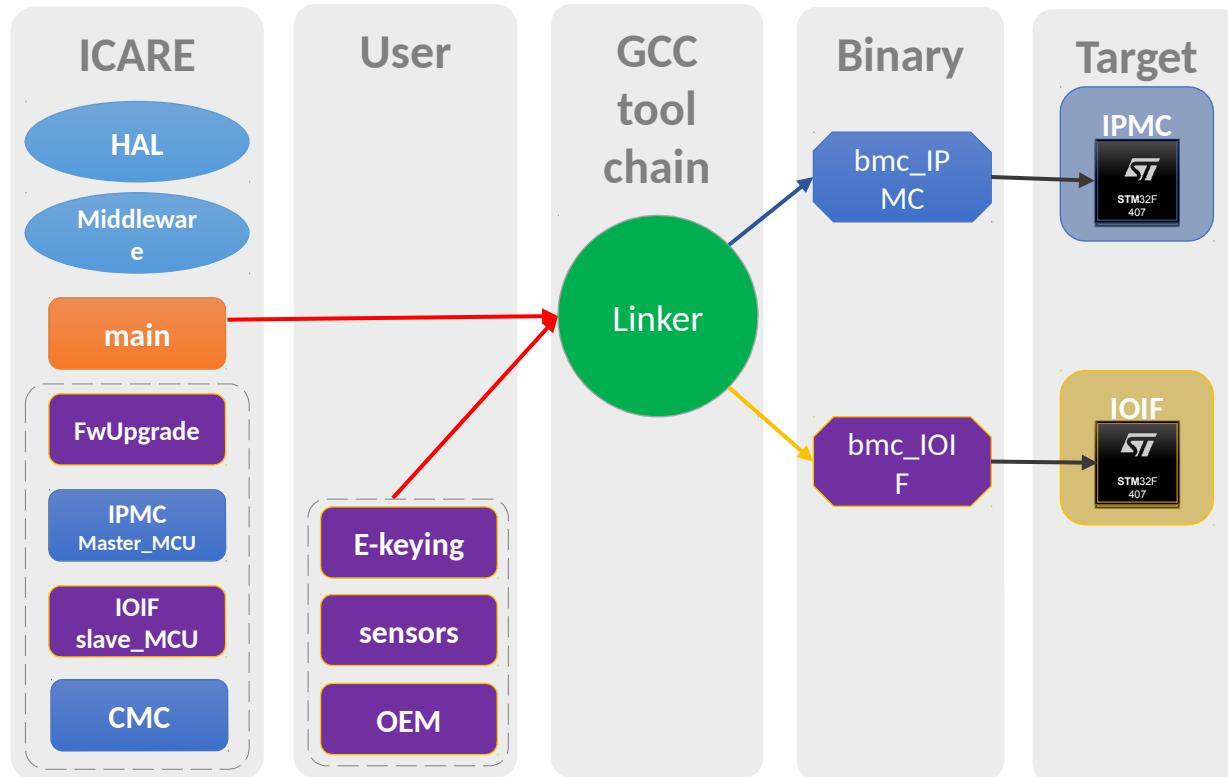

Software Environment

```

Setting up ICARE S/W release ICARE-00-01-00  
ICARECONFIG set to arm-gcc47-dbg  
[hayra@hepdaq002 ~]$
```

- Scientific Linux host development
- 32-bit ARM Cortex-M4 microcontroller
- Written in standard ANSI C
- GCC (4.7.0) tool chain
- Open Source Configuration Management Environment: CMT
- FRU generation utility (using M4 preprocessor)
- OpenOCD (0.9.0) utility (Linux/Windows)
 - Requires USB to JTAG interface Debug-Adapter-Hardware
 - Olimex ARM-USB-OCD-H
 - NGX technology
- Successfully running ICARE framework at QMUL

Software

- ICARE framework 00-01-00 release project structure
- Template projects available
- User modifications needed for specific hardware
 - I/O pin polarity ioconfig.h
 - Extra board information boardconfig.h
 - E-Keying channels p2p_ekeying.c
 - Sensors sensors.c
 - Configuration cfg_data.h

FRU management

Activation/De-activation state machine

M0 (not installed)

M1 (installed)

- CM read the FRU information
 - Current
 - E-keying
 - Clock

M2 (activation requested)

M3 (activation in progress)

- Enable power
- E-keying control
- Clock configuration

M4 (active)

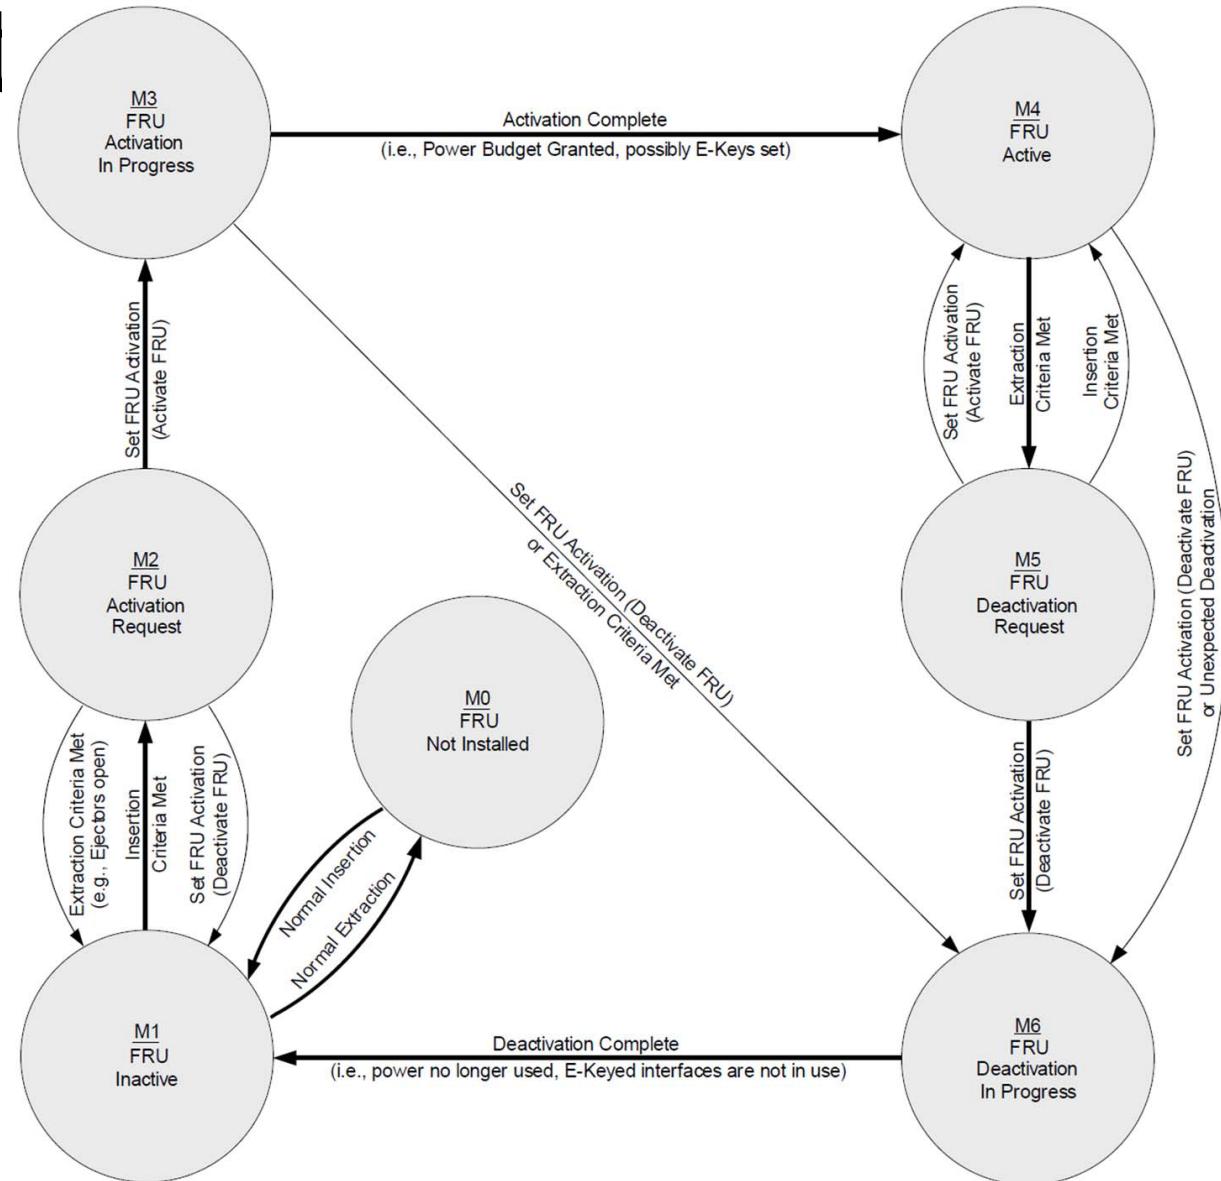

- Sensor, Power, Handle switch monitoring

M5 (Deactivation requested)

- E-keying de-activation
- Clock de-activation

M6 (Deactivation in progress)

- Disable power

EEPROM

- Used to store FRU/SDR information
- The Framework support EEPROM M24256 or 24xx256
- For an unsupported EEPROM the user must overwriting the following functions:
 - `bool prom_init(void)`
 - `bool prom_reset(void)`
 - `int prom_erase(unsigned addr, int len)`
 - `bool prom_busy(void)`
 - `int prom_read(void *dst, unsigned src_addr, int len)`
 - `int prom_write(unsigned dst_addr, void *src, int len)`
- By default FRU/SDR data are stored in 'IOIF' MCU memory.

Sensor

- The Framework support the following sensors
 - AD7414
 - LTC4151
 - LTC2499
 - IQ65033QMA10
- Registering sensor with the ResourceBroker library e.g.:

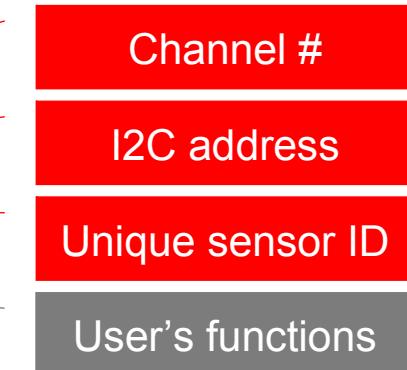

```
/*
 */
bool SensorsInit()
{
    RBResource_t stResource;

    // AD7414 Temperature
    stResource.ucChannelId = CHANNEL_I2C_SENSOR;
    stResource.ucAddress   = SDR_AD7414_I2C_ADDR;
    stResource.ucIdentifier = SDR_NUM_AD7414_TEMP;
    stResource.fnInit      = InitSensorAD7414;
    stResource.fnRead      = ReadSensorAD7414;
    stResource.fnWrite     = WriteSensorAD7414;

    if (ResourceBrokerAddResource("AD7414 Temp", &stResource) == false)
        return false;

    ...

    return true;
}
```

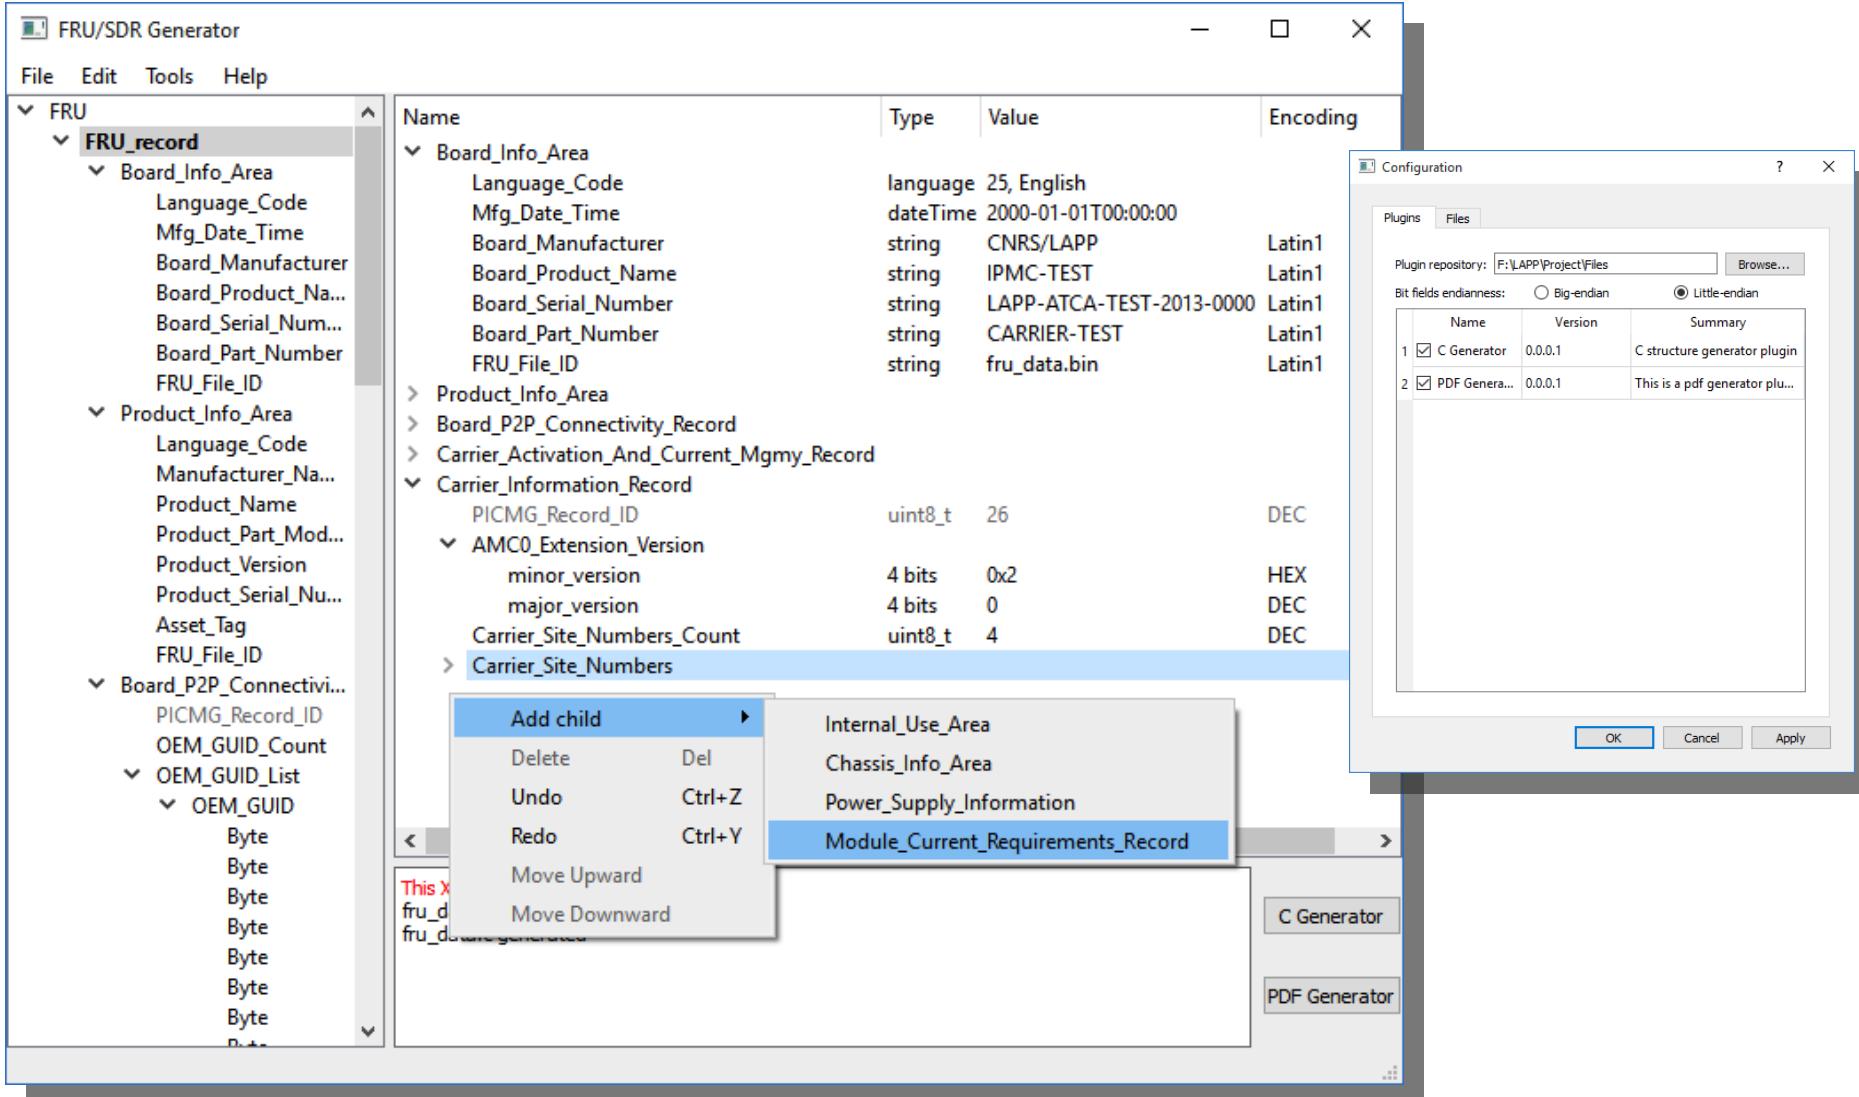

FRU/SDR

- FRU and SDR generation utility
- M4 file templates available
 - using M4 preprocessor
 - GUI interface
- User modifications needed for specific hardware
- Generates `fru_data.c` and `sdr_data.c`

FRU/SDR GUI setup

Things to do

- Get Test Board for the access to IPMC
- Setup USB to JTAG interface adapter-hardware
- Upgrade current firmware (to version 5.2)
- Get FRU/SDR generator utility and GUI
- Understand eeprom programming procedures
- Setup eFEX to use JTAG chain
