# Nothing Ain't What It Used to Be

## Featured Event

This event has been specially chosen by the Science Festival planning team! Here's what they have to say about it:

### Nothing Ain't What It Used to Be

Saturday, April 8th, 12:00-12:45 PM and 2:00-2:45 PM

Biomedical and Physical Sciences Building, Room 1420

A little bit of nothing goes a long, long way since, these days, nothing is really something. In fact, our understanding of nothing has changed in just the last few years in particle physics and in cosmology.

How do we know nothing? Well, since 2010, 7,000 of us have been peering into nothing at the CERN Large Hadron Collider in Geneva, Switzerland. We dug around in spacetime and reached an important conclusion about — wait for it — nothing!

At the same time, since 1998 hundreds of astronomers have been looking deep into the cosmos and they found...nothing as well! The nothing that we found at CERN is called the Higgs Boson...that little bit of the vacuum that makes everything...something. The nothing that astronomers uncovered is called Dark Energy, possibly the bang in the Big Bang.

Nothing is a very strange place and in this presentation, we'll talk about it.

Type: Talk or Demonstration

Description:

A little bit of nothing goes a long, long way, since, these days, nothing is really something. In fact, our understanding of nothing has changed in just the last few years in particle physics and in cosmology. How do

## Times and Locations

Date/Time: 4/8/2017 12:00 - 12:45 PM

Location: Biomedical and Physical Sciences Building, Room 1420

Ages: All Ages

Scientific Disciplines:

- Physics or Astronomy

hi

Lecture 24, 04.06.2017

Quantum Mechanics 4

# housekeeping

Question about anything?

*I'll make a movie for you.*

Poster selection:

*April 13, outline due April 20...read the instructions.*

Homework:

*For month of April, I've shifted due dates to Saturdays.*

# a problem

with my website as I've described in Facebook.

*It's still unavailable from a university computer*

*It is available everywhere else*

This week you should be reading:

*The Theory of Everything, Chapters 4 and 5*

*Physics, Concepts & Connections, Chapter 13*

# Honors Project

Data due April 22. Paper due on May 4 (final day).

Read the Second of two sets of instructions:

`MinervaInstructions2_2017.pdf` in

[www.pa.msu.edu/~brock/file\\_sharing/QSandBB/2017homework/honors\\_project\\_2017/](http://www.pa.msu.edu/~brock/file_sharing/QSandBB/2017homework/honors_project_2017/)

# Quantum Mechanics, so far:

Light has both wave and particle-like properties

Bohr Model:

- electrons are in atomic orbits

- fixed in radius and energy

- electrons make transitions - spectra

Electrons have both wave and particle-like properties

- for both light and electrons,  $p = \frac{h}{\lambda}$

- standing wave patterns at Bohr radii worked

Electrons are represented by imaginary wavefunctions,  $\psi$

- the square of the wavefunctions represent the probability of finding an electron at a point at a time

Heisenberg Uncertainty Principle:

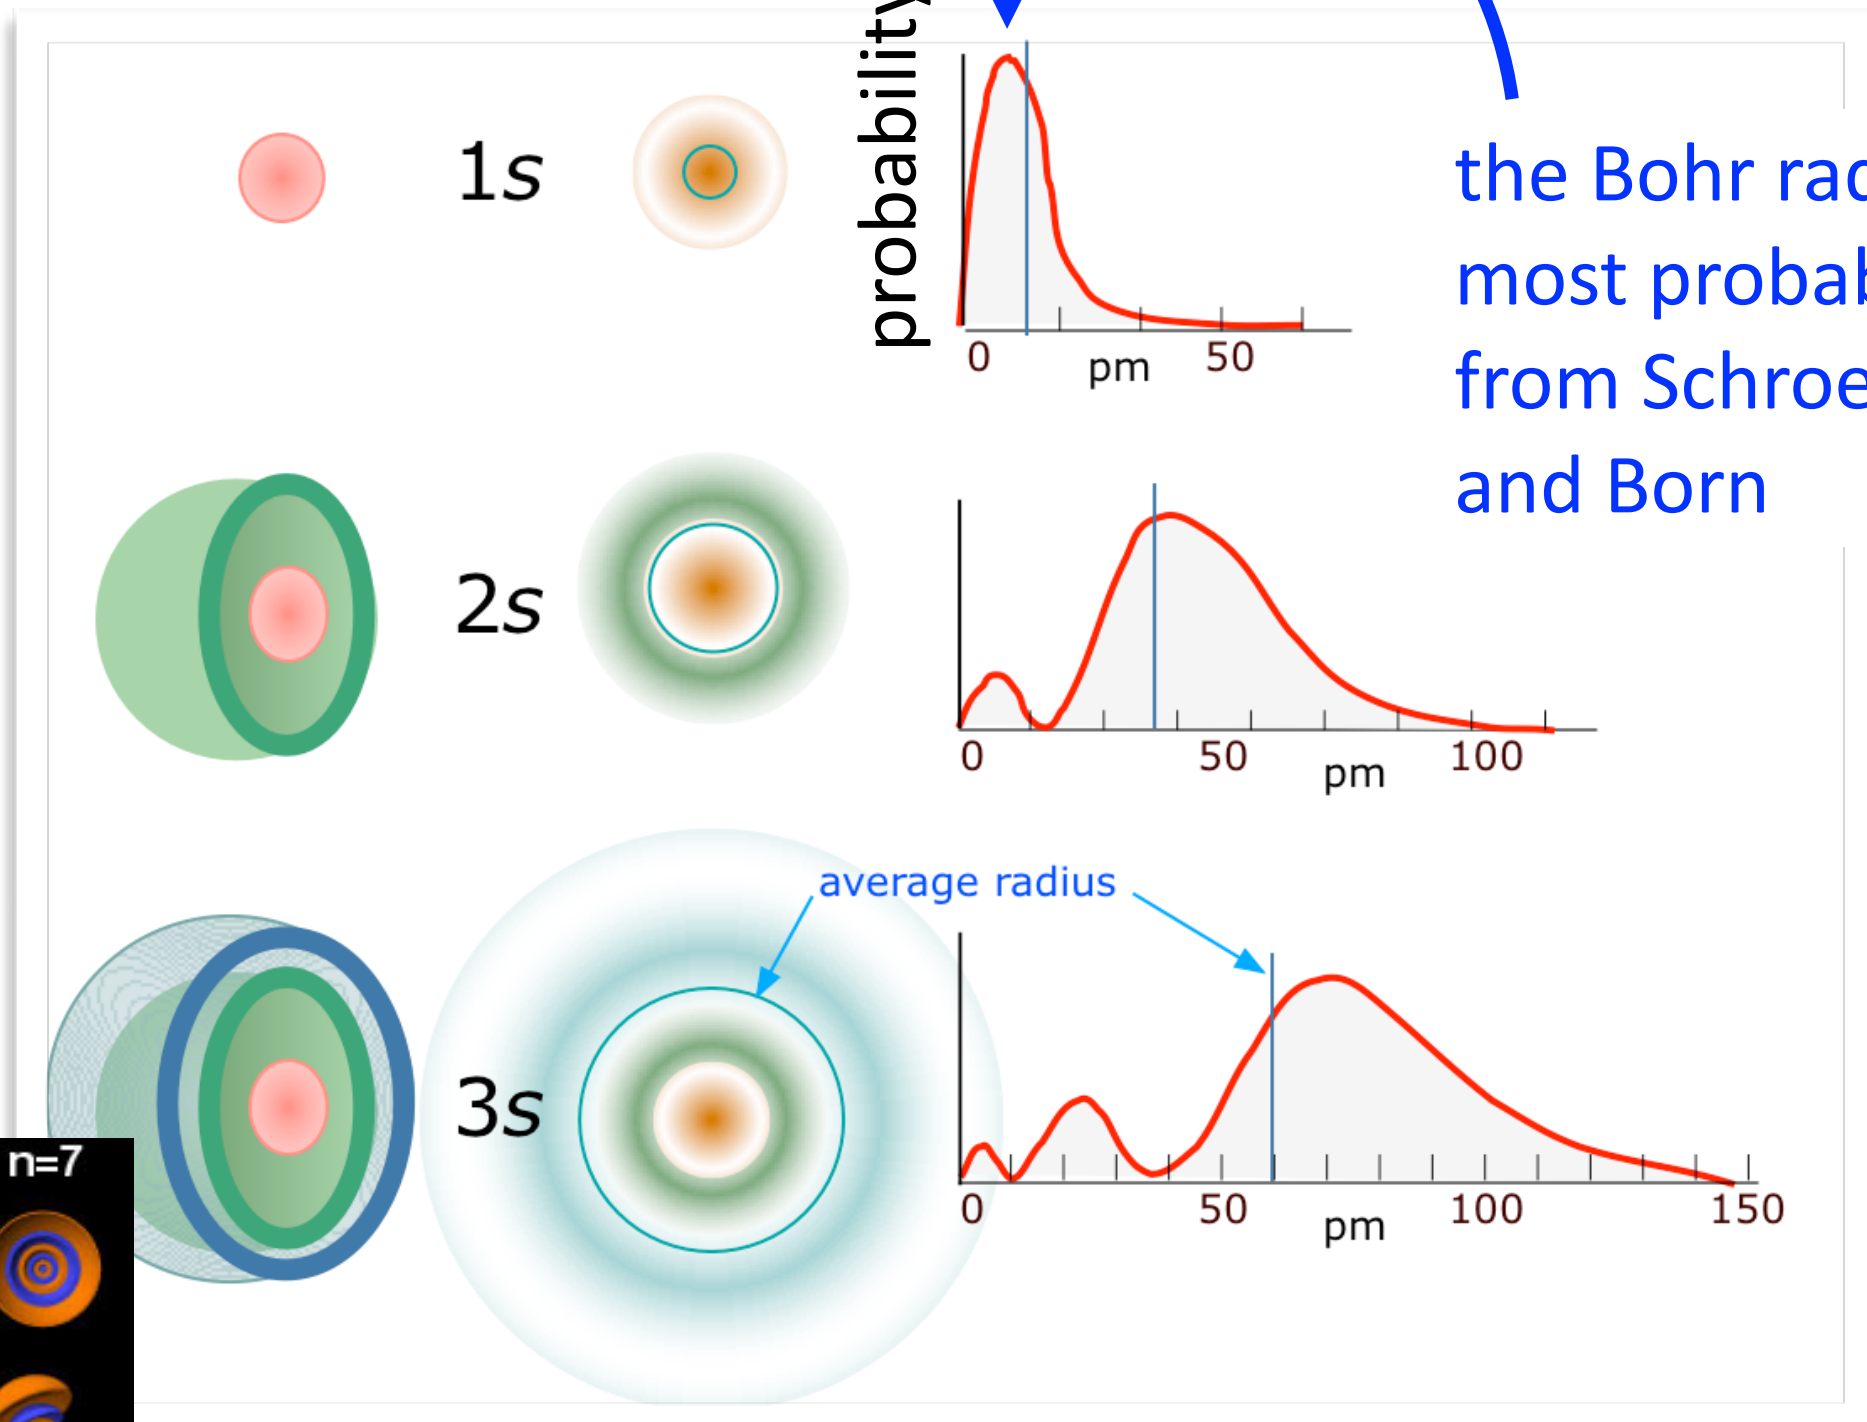

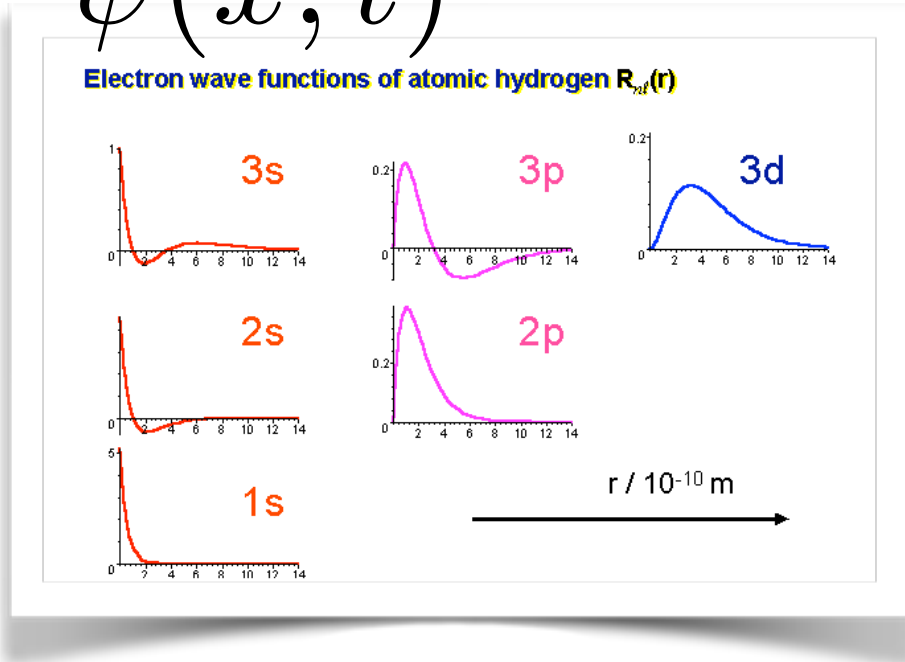

- measuring a precision location of a quantum makes momentum imprecise

- measuring a precision time interval of a quantum makes energy imprecise

# slice through the probability density of Hydrogen

Square these:

$$\psi(x, t)$$

there is

NO WAY to beat it in any of these measurement scenarios

the inverse relation between  $p$  and  $\lambda$  messes with you every time

$$p = \frac{h}{\lambda}$$

but here's the hard part

the inability to determine position or momentum to  
arbitrary precision

is not about poor instruments

It. Is. About. Nature.

relation alert:

## Heisenberg Uncertainty Relation

refers to:  $\Delta x \Delta p \geq h$  &  $\Delta t \Delta E \geq h$

an inherent property of Nature

example:

objects do not possess precise position and precise velocity at the same time.

### The Nobel Prize in Physics 1932

Werner Heisenberg

**Werner Karl Heisenberg**

The Nobel Prize in Physics 1932 was awarded to Werner Heisenberg *"for the creation of quantum mechanics, the application of which has, inter alia, led to the discovery of the allotropic forms of hydrogen"*.

Werner Heisenberg received his Nobel Prize one year later, in 1933. During the selection process in 1932, the Nobel Committee for Physics decided that none of the year's nominations met the criteria as outlined in the will of Alfred Nobel. According to the Nobel Foundation's statutes, the Nobel Prize can in such a case be reserved until the following year, and this statute was then applied. Werner Heisenberg therefore received his Nobel Prize for 1932 one year later, in 1933.

# a classical particle (dot) and its wavefunction

waves of different  
wavelengths?  
different momenta

Heisenberg Uncertainty Relation at  
work again

called "wavepackets"

$$p = \frac{h}{\lambda}$$

the wave combinations localize  
the state...with some spread in  $x$

all of the wave combinations means all of the  
momenta contribute: an spread in  $p$ .

The Schroedinger Equation is precisely,  
predictive

There is no ambiguity in how the quantum field evolves  
the only measurable is its probabilistic feature...

Is the quantum field function - the wavefunction - real?

I don't know. It cannot be observed...so moot.

Does it work as a description of Nature?

**absolutely...to exquisite precision**

# Nature's little joke

is encapsulated in a famous Feynman-description

a Gedankenexperiment...

S

two slit  
experiment  
2 + 1 ways

Two slit  
experiment  
with classical  
baseballs

$$P_A(D) + P_B(D) = P_{A+B}(D)$$

Like the “classical” situation of asking what is the probability of getting heads or tails in a coin flip...you’d add 0.5 and 0.5.

S

remember  
our wave-slit  
patterns?

Two slit  
experiment  
with waves

$$P_A(D) + P_B(D) \neq P_{A+B}(D)$$

Interference causes the characteristic  
diffraction pattern

S

A

B

bang  
bang

bang  
bang  
bang  
bang

bang  
bang  
bang

D

Since electrons are detected one by one as particles, we have to conclude that each electron must have passed through at random on either side of the biprism, thus creating a uniform distribution, without any interference when accumulated. (C)Hitachi, Ltd.

Two slit experiment with electrons?

$$P_A(D) + P_B(D) \neq P_{A+B}(D)$$

Interference causes the characteristic diffraction pattern

Same result as for waves.

*Maybe not a surprise given what's come before, eh?*

remember our wave-slit patterns?

S

A

B

D

bang  
bang

bang  
bang

bang  
bang

probabilities don't  
add

it's the **quantum  
fields** that do the  
wavy-ness!

$\psi$

$$P_A(D) + P_B(D) \neq P_{A+B}(D)$$

$$P_D = |\psi_A + \psi_B|^2$$

$$P_D = \psi_A^2 + \psi_B^2 + \psi_A \psi_B^*$$

at some points this can be **negative**  
sometimes **positive**

which gap did any electron come through?

okay...let's trick it

rig an alarm that sounds when an electron goes through a slit.

*Hah!*

Two slit experiment with **electrons** and an alarm?

So the sequence "S-A-A\*-D occurred.

Every time A\* rings - **red** curve. B\* rings, **blue** curve.

Same result as for baseballs.

Interference has gone away!!

Now: A\* is a **DISTINGUISHABLE** event from B\*

We specified the path...

and that changed the reality.

remember our wave-slit patterns?

# summarize

the classical  
situations

For **macroscopic objects**: outcomes add “normally”:

The result of  
whatgoesthroughA and whatgoesthroughB is  
the sum of whatgoesthrough(A **or** B)  
*one or the other*

For **waves**: outcomes interfere:

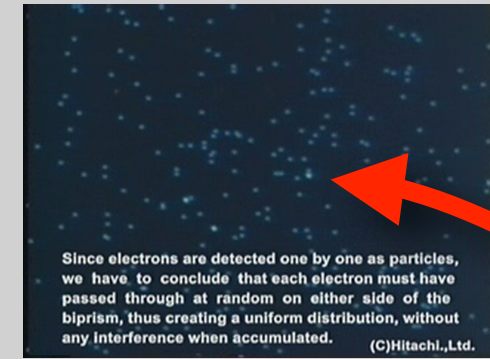

the result of  
whatgoesthroughA and whatgoesthroughB is  
the interference of whatgoesthrough(A **and** B)  
*both at the same time*  
***the waves interfere***

# where is the electron

it's real only when  
you make a  
measurement

and your  
measurement can  
determine how it's  
real

Since electrons are detected one by one as particles, we have to conclude that each electron must have passed through at random on either side of the biprism, thus creating a uniform distribution, without any interference when accumulated. (C)Hitachi, Ltd.

The electron is real at the screen.  
it's unambiguously...there.  
the "bang" is a measurement

what about here?

We have to say that an electron:

- goes through both slits
- and is in a "superposition" state,  
*here of both the state  $\psi_A$  and the state  $\psi_B$*

As soon as measurement is made...the superposition goes away and the potentiality becomes the actuality...according to the probabilistic prediction of the Schroedinger Equation.

what we can say is real

is now very tricky  
and not understood.

We know that quantum fields contain all of their  
potentialities

and a measurement "collapses" them into just one outcome

the concept of a "measurement" is totally not understood.

the  
wavefunctions  
are  
everywhere

spread out and  
overlapping

that's how molecules  
stay together

but...jeez.  
everywhere.

doesn't go to zero.

There's a probability that the  
electron in one of your water  
molecules might spend a brief  
time at the Louvre

A

B

Something big...seems to have a definite trajectory

Something tiny...doesn't.

# the wavefunctions are everywhere

They're waves, after all.

make a measurement...there

Only then is it real.

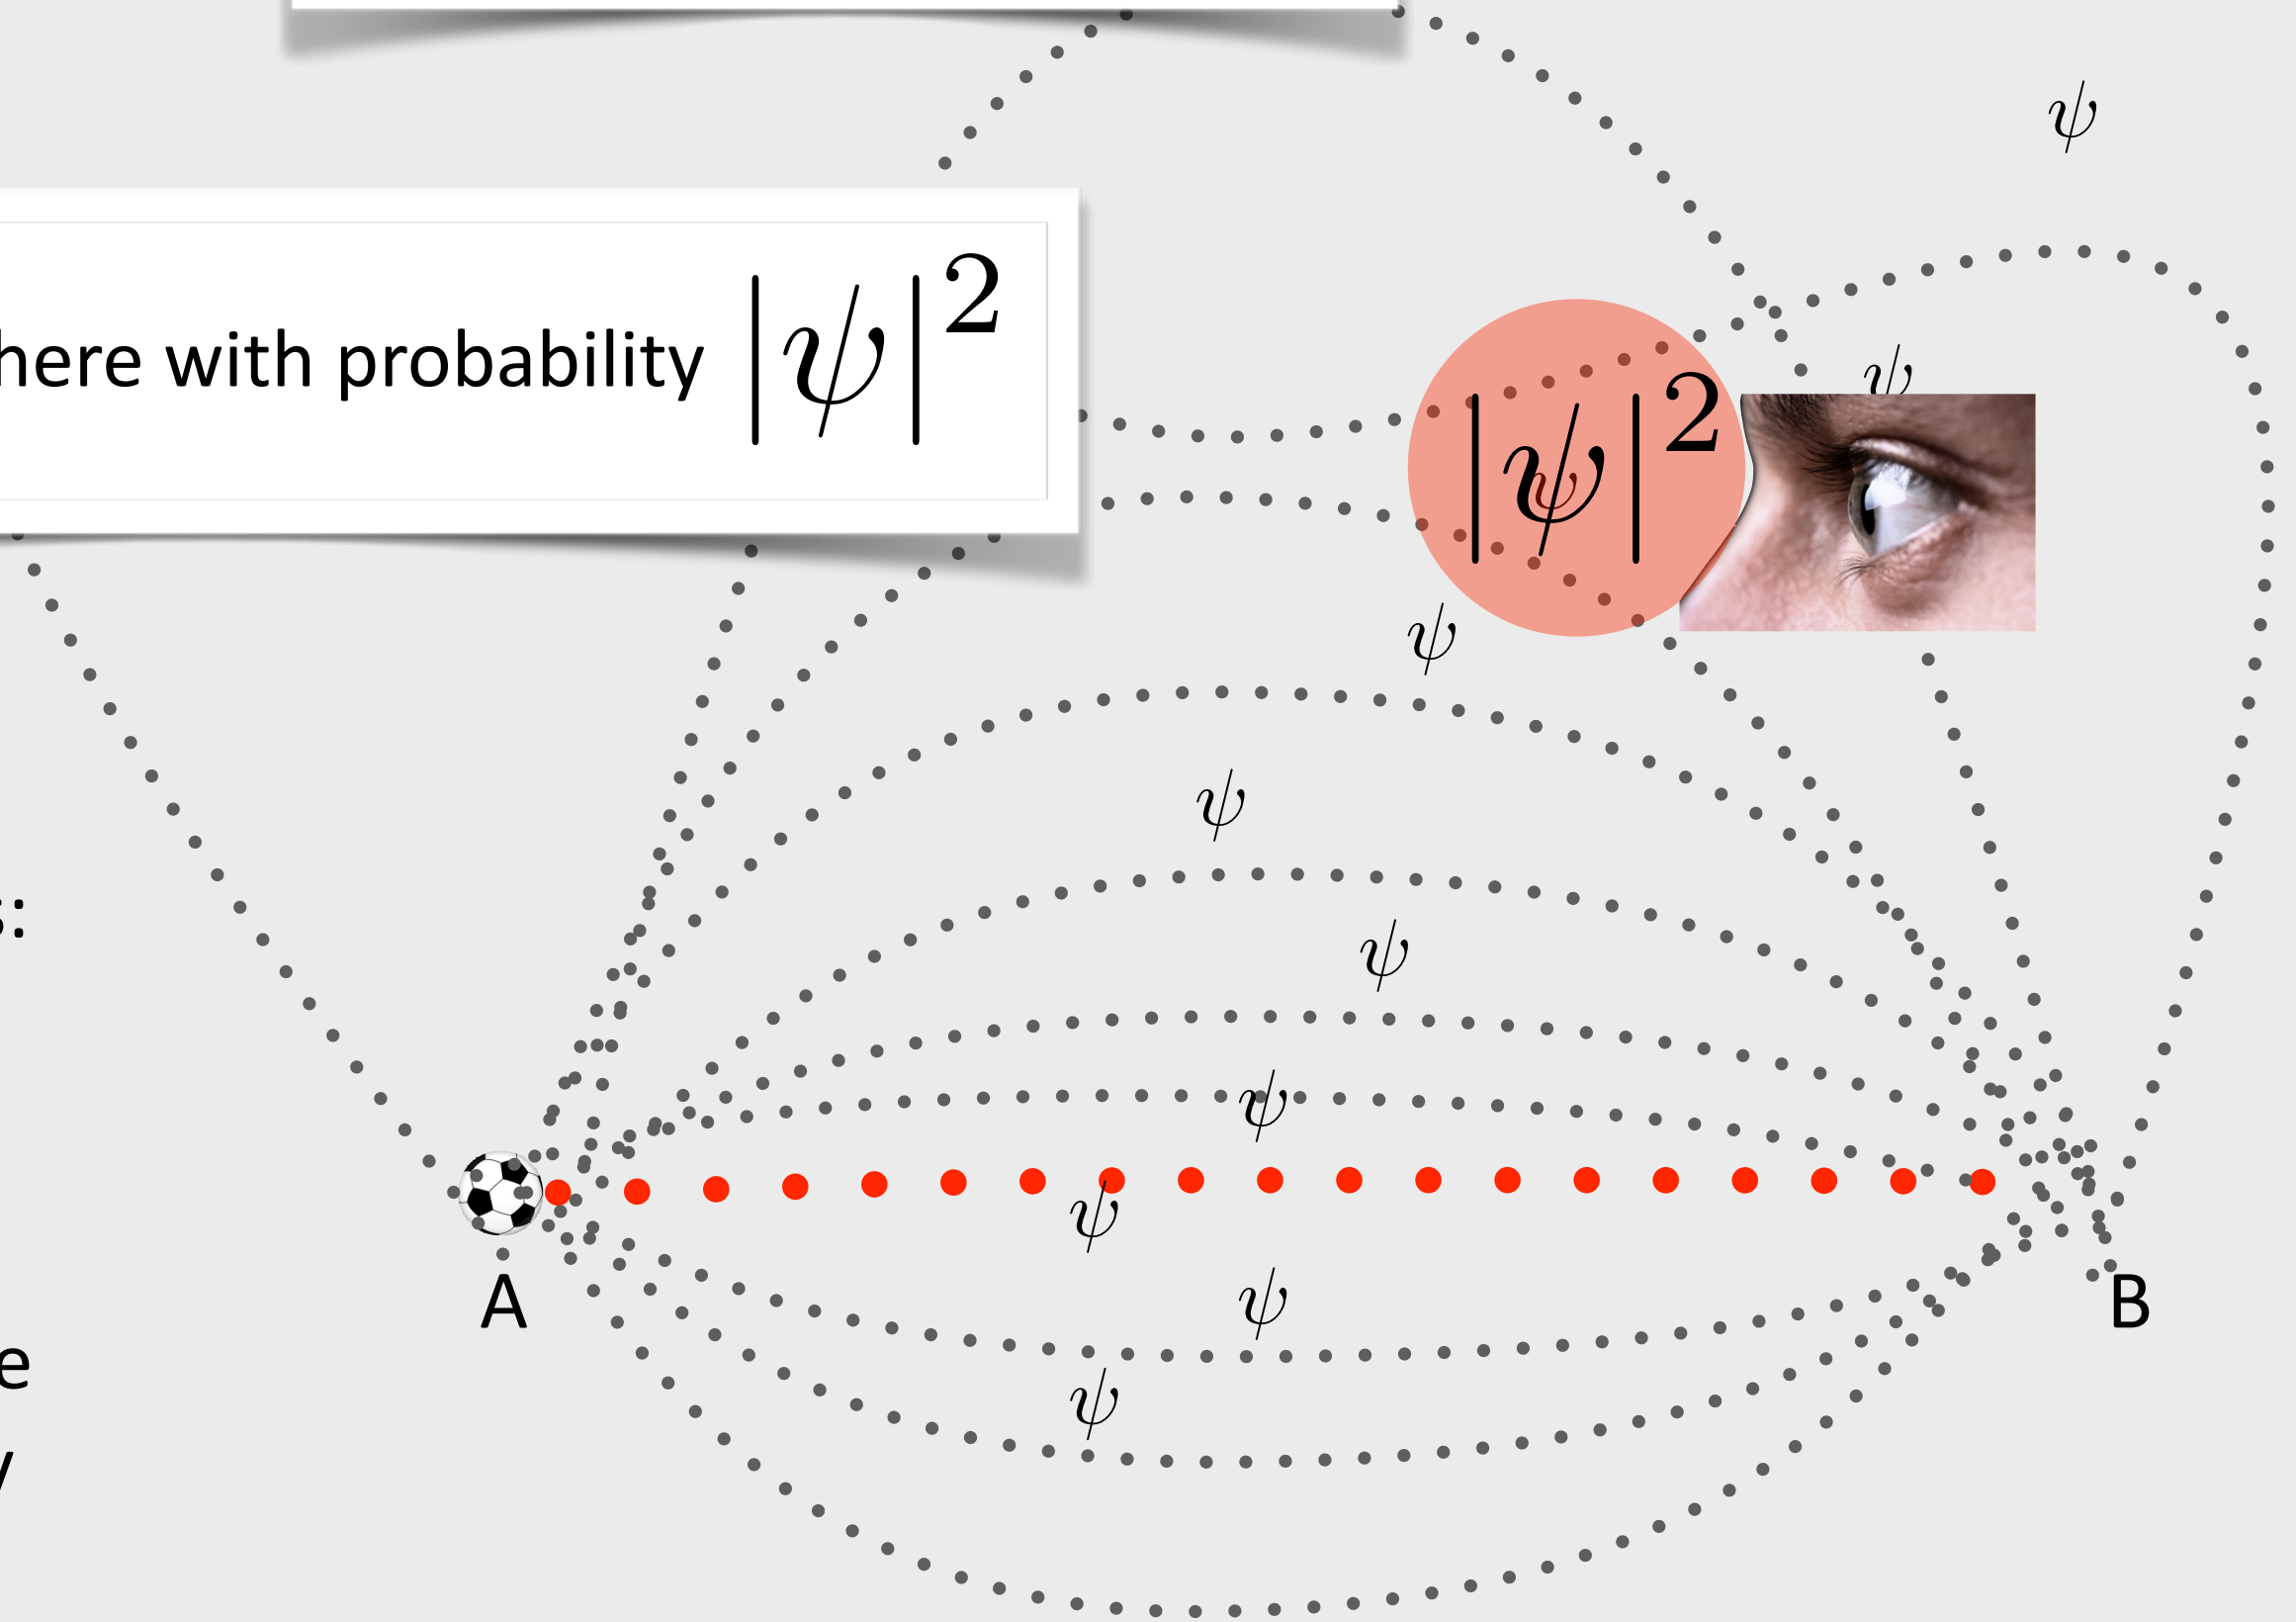

the electron is there with probability  $|\psi|^2$

Feynman's picture was one of particles: which take all possible paths

We can calculate the wavefunction at any point, very precisely...it's completely deterministic

The trajectory of a big object?

**Overwhelmingly probable quantum likelihood: the classical path**

so where is a quantum

before it's measured?

anywhere? everywhere?

yeah.

to take it to an absurd conclusion:  
the dreaded Schroedinger's Cat

proposed by Schroedinger as an absurdity

*because he too had become disgusted with this own creation - he  
switched to biology!*

# Schroedinger must have been a dog person

Imagine:

a radioactive source,

Geiger counter, and

a glass bottle of a **deadly poison**

**with a cat**

**in a box,**

*a weight drops on the glass, breaking it*

*after the first radioactive decay?*

*...dead cat.*

# Schroedinger must have been a dog person

Now imagine that the radioactive nucleus as a **half life of 10 sec.**

*so, after 10 s,*

*50-50 chance that it has decayed*

Set it all up...wait for 10 seconds.

*what is the state of the cat?*

*alive or dead?*

*or both?*

# ‘‘Copenhagen Interpretation’’

It is meaningless  
*to speak of reality without a measurement*

Entities have no definite reality  
*the cat is neither alive nor dead  
or it is both*

To know you must open the box  
*make a measurement*

this is how we have to think about it:

before measurement: alive-dead state -  
**superposition state of both**

after measurement: is **either** alive **or** dead

here's our house

just before painting  
last year

need to pick a color:

*my wife says "red"*

*I say "blue"*

**SHERWIN-WILLIAMS®**  
*quantum paint*

I expect it to be:

purple

mixing red and blue

but the quantum mechanical paint

that I paid extra for?

can't "exist" in a  
superposition, mixed state.

Only one state.

*sometimes it's red*

but the quantum mechanical paint

that I paid extra for?

*sometimes it's blue*

it's never the  
mixture

that it potentially might  
be

one or the other

More red paint?

not redder...just red more often

the cat is either alive or dead,  
not both.

“

I think I can safely say that nobody understands quantum mechanics.

**Richard Feynman**

But we can calculate with Quantum Mechanics very, very well.

We're all highly skilled Quantum *Mechanics*

# electrons are little magnets

They behave in a  
magnetic field as  
if they are little  
spinning current  
spheres

The electron **itself** is *like* a spinning charge...

Electrons have an **intrinsic** angular momentum, "S": "spin"

$$S_z = m_s \frac{h}{2\pi}$$

But, the "spin" can only take on two values:

$$m_s = +\frac{1}{2} \quad \text{or} \quad m_s = -\frac{1}{2}$$

We say

"spin, plus 1/2" or "spin up"

and

"spin, minus 1/2" or "spin down"

The electron is NOT

a ball of spinning charge

its outer edges would have to move  $\gg c$

This is a quantum mechanical feature with no classical analog

## Pauli Exclusion Principle:

No two electrons can be in the same quantum state

that is, have identical "quantum numbers"

...integers that characterize the atom

Carbon... 6 electrons,  
6 protons, 6 neutrons:

# The Pauli Exclusion Principle

Explains it

& SPIN is the reason

"1s<sup>2</sup> 2s<sup>2</sup> 2p<sup>6</sup> 3s<sup>2</sup> 3p<sup>6</sup>..."

How come Carbon *is* like:

The Pauli Exclusion Principle still works

...since spin up  $\neq$  spin down, so different quantum states

## The Periodic Table

1 H																	2 He
3 Li	4 Be											5 B	6 C	7 N	8 O	9 F	10 Ne

The combination of Schroedinger, Pauli, Uhlenbeck and Goudsmit - explained the Periodic Table

jargon alert:

## **fermion**

refers to:

any particle with half-integer spin

entomology:

from Fermi's theoretical work on the behavior of large numbers of Fermions

example:

electron, proton, neutron

jargon alert:

## **boson**

refers to:

any quantum object with integer spin

etymology:

from Satyendra Nath Bose, who worked on the effects of multiple boson aggregates

example:

photon, pion, Higgs Boson

spin is a defining quality of an electron

## electron

symbol:

$e$

charge:

$-1e$

mass:

$m_e = 9.0 \times 10^{-31} \text{ kg} \sim 0.0005 \text{ p}$

spin:

$1/2$

category:

fermion, lepton

particle:

**proton**

symbol:

$p$

charge:

$+1e$

mass:

$m_p = 1.6726 \times 10^{-27} \text{ kg} = 1 \text{ p}$

spin:

$1/2$

category:

fermion, hadron

again, an inherent angular momentum and a defining property of photons

particle:

**photon**

symbol:

$\gamma$

charge:

0

mass:

$m_{\gamma} = 0$

spin:

1

category:

boson, aka Intermediate Vector Boson

shifting gears

antimatter

here's a number:

0

0

zero

the # of successfully combined models of  
Quantum Mechanics and Relativity  
prior to 1928

remember the  
relativistic  
energy  
relationship

and compare it to  
the non-  
relativistic one

## Classical

$$E = \frac{1}{2}mv^2$$

$$p = mv$$

$$v = \frac{p}{m}$$

## Relativistic

$$E^2 = (m_0c^2)^2 + (pc)^2$$

that square is problematic since it suggests:

$$E = \pm \sqrt{(m_0c^2)^2 + (pc)^2}$$

translated to Schroedinger QM:

**negative energies for freely  
moving electrons**

negative energies for unbound systems

a disaster

negative energies for unbound systems

a disaster

negative energies for unbound systems

a disaster

there's no bottom!

worse!

Quantum Mechanics using Relativity:

required not only negative energies

negative probabilities!

# 1928

Paul Dirac

1902 – 1984

“

At the question period after a Dirac lecture at the University of Toronto, somebody in the audience remarked: "Professor Dirac, I do not understand how you derived the formula on the top left side of the blackboard."

"This is not a question," snapped Dirac, "it is a statement."

hilarious interview with the  
Wisconsin State Journal from 1929  
on the blog.

# Dirac's Mathematical Imagination

Dirac embraced the negative energy

Solved the negative probability

Dirac set out to find an equation that would solve both problems

**Dirac's imagination**

The "Dirac Equation" is the correct equation for electrons: Probabilities turn out okay, but required interpretation of negative energies

negative  
electric charge  
**+ Energy**

positive  
electric charge  
**- Energy**

## Dirac's result

required: 4 quantum fields, rather than 1  $\psi_{up}(E, \vec{p}) \psi_{down}(+E)$

2 have positive energy, 2 have negative energy  $\psi_{up}(E, \vec{p}) \psi_{down}(-E)$

each pair is related precisely to spin

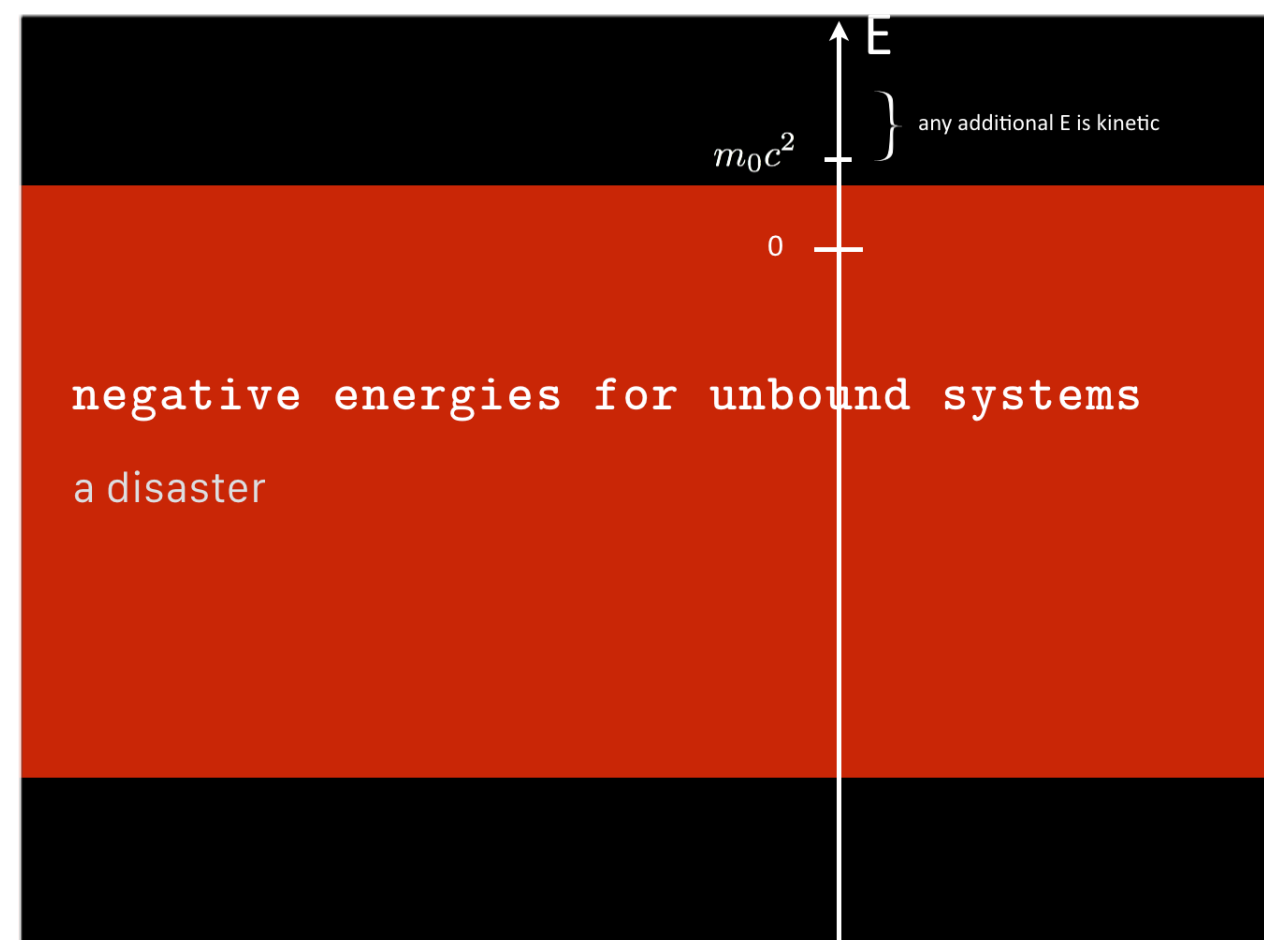

**Dirac showed that spin is a wholly relativistic effect  
...it just popped out of his equation.**

# still negative energies?

"solved" it with  
Pauli's Exclusion  
Principle

His vacuum is  
full of negative  
energy  
electrons

start  
with  
nothing

$$E_\gamma > 2 m_e c^2$$

**NOTHING**  
+ **Energy**

---

Let's talk about  
Nothing.

Dirac began this  
discussion

which continues today

in particle physics

and in cosmology

what is this?

$\psi(-E)$  a positively charged object with negative energy?

At first, he thought: "proton"

nah. A bolder idea: an anti-electron. The Positron.

*Yes...antimatter.*

modern  
interpretat

a photon  
poof-disappears

The antimatter story has a  
happy ending:

1932

# Cosmic Rays

very high energy  
protons from  
space

~2 per minute per fingernail

# Carl Anderson

clever...put in a lead plate to cause particles to lose energy

look at this track...

sharper curvature at top

**DOWN** and negative?

**UP** and positive? ✓

B field in

*Yes...antimatter.*

Right on schedule: 1932

B field in

the bar over the top will mean  
“antiparticle”

## anti-electron, aka “positron”

symbol:

$\bar{e}$  or  $e^+$

charge:

$+1e$

mass:

$m_e = 9.0 \times 10^{-31} \text{ kg} \sim 0.0005 \text{ p}$

spin:

$1/2$

category:

anti-fermion, anti-lepton

# antimatter

is a fact of life

every particle has it's anti-particle partner

same mass, different electrical charge

# Dirac Nobel

# Carl Anderson and Victor Hess

Anderson was 31

The screenshot shows the Nobelprize.org website. At the top, the logo and tagline "The Official Web Site of the Nobel Prize" are visible. A navigation bar includes "Nobel Prizes", "Alfred Nobel", "Educational", "Video Player", and "Nobel Organizations". The breadcrumb trail reads "Home / Nobel Prizes / Nobel Prize in Physics / The Nobel Prize in Physics 1936".

On the left is a sidebar menu with categories like "About the Nobel Prizes", "Facts and Lists", "Nobel Prize in Physics", "Nobel Prize in Chemistry", etc. The "Nobel Prize in Physics" section is expanded, listing various resources.

The main content area features a timeline from 1901 to 2012, with 1936 selected. Below the timeline, there are options for "Sort and list Nobel Prizes and Nobel Laur" and "Prize category: Physics".

The main heading is "The Nobel Prize in Physics 1936" with laureates "Victor F. Hess, Carl D. Anderson". Below this, there are dropdown menus for each laureate, followed by their respective black and white portraits.

Under the portraits, the names "Victor Franz Hess" and "Carl David Anderson" are listed. Below the names, a paragraph states: "The Nobel Prize in Physics 1936 was divided equally between Victor Franz Hess 'for his discovery of cosmic radiation' and Carl David Anderson 'for his discovery of the positron'".

At the bottom right, the date "Nobelprize.org. 20 Mar 2013" and the URL " laureates/1936/" are visible.
